## **ACKNOWLEDGEMENT**

First of all I would like to express my sincere gratitude and special thanks to my only supervisor, Prof. Faizah Shaharom for her supervision, assistance and comments that enable this project run smoothly.

I also want to thank my coordinator, Pn Asma for her guidance to finish this project. I am also very grateful to Pn. Kartini for her willingness to spare her time and expertise unselfishly to guide me in laboratory works. Beside that, my sincere thanks also go to Mr. Zan for helping and provide some facilities during my lab work periods.

My highest appreciation also goes to my friends who have helped me a lot in finishing this project. My deepest gratitude goes to my parents for their endless love, concern and support for my life.

## **ABSTRACT**

A total of forty fish samples (*Nibea soldado*) were obtained from the market at the Kuala Terengganu Coast during pre-monsoon season (August –October, 2008) and monsoon season (November – January, 2009) with twenty fish sample per season. The fish samples were examined with the reference to the prevalence and mean intensity of the parasites found. A total of 4 species of parasites were discovered throughout the study: One species from class cestoda; two species from nematode (*Spirocammallanus spp.* and *Contracaecum sp*), one species from acanthocephala and another one is digenea. From the stations being sampled, infection level for nematode (*Spirocammallanus spp.* and *Contracaecum sp*) during monsoon season were the highest compared to pre-monsoon season.

## **ABSTRAK**

Sejumlah empat puluh sampel ikan (*Nibea soldado*) telah diperolehi dari pasar di pantai Kuala Terengganu pada musim kering (Ogos- Oktober, 2008) dan musim hujan (November-Januari, 2009) dengan setiap musim masing-masing tiga puluh sampel ikan. Sampel ikan telah diperiksa untuk menentukan prevalen dan min keamatan parasit yang dijumpai. Sebanyak empat spesies telah dijumpai sepanjang kajian: satu spesies dari kelas cestoda; dua spesies dari nematode (*Spirocammallanus spp.* and *Contracaecum sp*), satu spesies dari acanthocephalan dan satu lagi ialah digenea. Tahap jangkitan untuk nematode (*Spirocammallanus spp.* dan *Contracaecum sp*) semasa musim hujan adalah lebih tinggi berbanding dengan musim kering.
