PENGAKUAN DAN PENGESAHAN LAPORAN PROJEK ILMIAH I DAN II

Adalah dengan ini diakui dan disahkan bahawa laporan ilmiah bertajuk:

Study of monogenea parasites on gills of *Mystus nemurus* cultured in Terengganu River oleh Nor Fadilah binti Mad Daud, No.Matrik UK14624 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Perikanan dan Akuakultur sebagai memenuhi sebahagian daripada keperluan memperolahi Ijazah Sarjana Muda Sains Agroteknologi (Akuakultur), Fakulti Agroteknologi dan Sains Makanan, Universiti Malaysia Terengganu.

DECLARATION

I hereby declare that the work in this thesis is my own except
for quotations and summaries which have been duly
acknowledged.

Signature : 

Name : Nor Fadilah binti Mad Daud

Matric No : UK14624

Date : 7th May 2009

ACKNOWLEDGEMENT

First of all, my sincere thanks goes to my supervisor, Prof. Dr. Faizah Shaharom for her supervision, guidance, comments and assistance from the beginning, enable this project run smoothly. Thank you to Mrs. Kartini for the helps and also to Mr. Sharol and Mrs. Faridah for the permission of using the facilities in Anatomy and Physiology Laboratory. Special appreciation goes to my family and friends for their spiritual and mental support. Lastly, thanks to everyone those who have contributed to this project especially my partner, Nurul Huda Abdullah. Thank you very much.

ABSTRACT

A study was conducted to identify the monogenean parasite species infecting *Mystus nemurus* from cage culture in Terengganu River. Samples were collected from cage culture in Terengganu River. Sampling was done four times; during monsoon season in November and after monsoon season in January. The mean intensity and prevalence of parasites infestation for both season was compared. The mean intensity in the two seasons shows a very different number where it is higher after monsoon season. The relationship between length of host fish and the number of parasites was made separately in the two seasons. In both season, the results show that the bigger the fish, more number of monogenea were found. The descriptions of the species that were made based on previous studies, suggested that this species belongs to genus *Cornudiscoides*.

ABSTRAK

Satu kajian telah dijalankan untuk mengenalpasti spesis parasit monogenea yang menjangkiti spesis *Mytilus nemurus* daripada ternakan dalam sangkar di Sungai Terengganu. Sample diambil daripada ternakan sangkar di Sungai Terengganu. Penyampelan telah dilakukan sebanyak empat kali; dalam musim monsun dalam bulan November dan selepas monsun dalam bulan Januari. Purata dan kelaziman jangkitan parasit dibandingkan untuk dua musim tersebut. Purata jangkitan dalam kedua-dua musim tersebut menunjukkan perbezaan ketara di mana purata jangkitan semasa monsun lebih tinggi berbanding selepas monsun. Perkaitan antara panjang hos dan bilangan parasit dilakukan secara berasingan antara dua musim tersebut. Bagi kedua-dua musim, keputusan menunjukkan semakin besar ikan, semakin banyak bilangan monogene yang ditemui. Daripadauraian mengenai spesies yang dijumpai yang dibuat berdasarkan kajian-kajian sebelum ini, spesis ini dicadangkan berasal dari genus *Cornudiscoides*.
