## **DECLARATION**

I hereby declare that the work in this thesis is my own except for quotations and  
summaries which have been duly acknowledged

Signature : .....

Name : Nur Idayu Bte Maruan

Matric No. : UK 15284

Date : 16 May, 2009

## **ACKNOWLEDGEMENT**

“In the name of Allah, the most gracious and the most merciful”

First of all, I would like to thank to my supervisor Assoc. Prof. Dr. Najiah bt. Musa and Pn. Nur Asma Bte Ariffin for giving me a chance to carry out my final year project. Secondly, thank you for all demonstrators that willingly to spare their knowledge and precious time just to make aquacultures student more competent in handling the final year project. This knowledge is useful enough, to support our jobs and careers in the future. Not forget to my family and all my friends that related in helping me in finishing the thesis. Thank you for all of them.

## ABSTRACT

A study was carried out to determine bacterial count on larvae waste of Giant freshwater prawn (*Macrobrachium rosenbergii*) collected from the bottom tank at University Malaysia Terengganu Marine Hatchery, and their resistance to various antibiotics and heavy metals. The bacteria were isolated using non-selective agar Trypticase Soy Agar (TSA) and selective agar were Thiosulfate Citrate Bile Sucrose TPC (TCBS), Mac Conkey, Pseudomonas Aeromonas Selective Agar base (GSP), Eosin Methylene Blue (EMB) and Xylose Lysine Deoxycholate (XLD). The plate counts ranged from  $7 \times 10^2$  to  $1.53 \times 10^4$  bacterial per disc for larvae waste of *M.rosenbergii*. The bacteria genera found on larvae waste were *Vibrio*, *Pseudomonas*, *Aeromonas* and *Escherichia*. This bacteria were the most frequently found encountered genera based on appearance and growth of colonies on selective agar. A total of 50 strain bacterial isolates isolated from larvae waste of *M.rosenbergii* was examined the antibiotic resistance and results showed that the bacterial resistance to lincomycelin was highest followed by oleandomycin, novobiocin, spiramycin, deoxycyclin, ampicilin, amoxicillin and tetracycline. Most of the isolates were tolerant to all heavy metal test with the pattern of Hg = Cd = Cr > Cu. These results indicate that bacteria isolate resistance to antibiotic and heavy metal posing a potential public health risk.

## **ABSTRAK**

Suatu kajian telah dijalankan untuk menentukan bilangan bakteria pada sisa buangan larva Udang Galah (*(Macrobrachium rosenbergii)*) yang diperolehi daripada dasar tangki hatceri air masin Universiti Malaysia Terengganu dan ketahanannya terhadap pelbagai antibiotik dan logam berat. Bakteria dipencarkan pada media umum iaitu Trypticase Soy Agar (TSA) dan media selektif iaitu Thiosulfate Citrate Bile Sucrose TPC (TCBS), Mac Conkey, Pseudomonas Aeromonas Selective Agar base (GSP), Eosin Methylene Blue (EMB) ) dan Xylose Lysine Deoxycholate (XLD) ). Bilangan koloni bakteria yang terbentuk pada medium agar adalah di antara  $7 \times 10^2$  to  $1.53 \times 10^4$  per ml. Genera bacteria yang biasa ditemui adalah *Vibrio*, *Pseudomonas*, *Aeromona* and *Escherichia*, dimana ia ditentukan berdasarkan kemunculannya dan pertumbuhan koloni di atas agar selektif. Sejumlah 50 pemenciran bakteria yang dipencarkan daripada sisa buangan larva udang galah diperiksa ketahanannya terhadap antibiotik dan keputusan yang diperolehi mendapat ketahanan bakteria yang tinggi kepada lincomycin dengan diikuti oleh oleandomycin, novobiocin, spiramycin, deoxycyclin, ampicillin, amoxicillin dan tetracycline. Didapati pemenciran bakteria juga bertoleransi dengan semua ujian logam berat iaitu dengan pola  $Hg = Cd = Cr > Cu$ . Keputusan ini menunjukkan ketahanan bakteria terhadap antibiotik dan bahan logam berat, berisiko tinggi untuk menjaskan kesihatan
