PENGAKUAN DAN PENGESAHAH LAPORAN PROJEK ILMIAH I DAN II

Adalah ini diakui dan disahkan bahawa laporan ilmiah bertajuk: The Study of Prevalence, Mean Intensity and Morphology of *Digenea sp.* In *Mystus Nemurus*. Oleh Nurul Farhana Binti Ramli, No. Matrik UK13918 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada **Jabatan Sains Perikanan dan Akuakultur** sebagai memenuhi sebahagian daripada keperluan memperolehi **Ijazah Sarjana Muda Sains Agroteknologi (Akuakultur)** Fakulti Agroteknologi dan Sains Makanan, Universiti Malaysia Terengganu.

Date : 30 April 2009

ACKNOWLEDGEMENT

First of all I would like to thanks to Prof Dr Faizah Shaharom that always give me ideas, comments and guidance so that this study can run smoothly. Thanks also to Puan Karitini who always help me in every aspect including in the staining process of the parasite and also for providing the chemical that are needed in this study. Thanks you also to En Ihwan and Puan Wahidah for providing me the fish and also for your guidance and ideas.

After that, I want to thanks to my mother Che Faridah binti Derahman who always gives morale support. Thank also to Muhammad Firdaus bin Zulazlan who always besides me when I have a problem, and always give me support. Also to all my friends that give me help and give a spiritual support to me. Finally I would like to thanks to everybody that help me while I finishing this study.

ABSTRACT

The study was done on *Mytilus nemurus* fish in The Tasik Kenyir Reservoir. 37 fishes were examined in order to obtain digenean parasite infecting the *Mytilus nemurus* fish and to determine prevalence, mean intensity of digeneans found. The morphological description of the digeneans was also done. The digeneans that were in stomach and intestine have the same morphological structures. So, most probably they are from *Euhaplorchis sp.* The prevalence and mean intensity of the digenean parasites were high in the intestine of the fish compared to the stomach of the fish. The composition of the digeneans also showed that the digeneans have site specificity at the anterior part of the intestine; site A. Factors like environment, physiology of the digeneans and morphology of the fish probably influence the accumulation of the parasite in *Mytilus nemurus*. Histology part also was done to see the digenean group in the small intestine of the fishes. It was observed that the infection of the digeneans to the *Mytilus nemurus* was not related to the total length of the fish.

ABSTRAK

Kajian ini telah dijalankan kepada spesis ikan liar, *Mystus nemurus* yang berada di Tasik Kenyir. Sejumlah 37 ikan telah diperiksa demi menentukan prevalen dan min keamatan species digeneans yang dijumpai di dalam kajian ini. Huraian mengenai morfologi digenea juga telah dilakukan. Digenean yang dijumpai di dalam perut dan usus ikan tersebut mempunyai struktur morfologi yang sama. Jadi kemungkinan besar, digenea yang dijumpai adalah dari spesis *Euhaplorchis sp*. Prevalen dan min keamatan digenea tinggi di dalam usus berbanding di dalam perut ikan. Spesis digenea yang berkumpul di dalam usus ikan menunjukkan bahawa digenea tersebut lebih memilih di bahagian hadapan usus; bahagian A. Faktor persekitaran, bentuk fizikal digenea dan morfologi ikan telah mempengaruhi jangkitan digenea terhadap ikan ini. Kajian histologi bagi usus kecil ikan telah dijalankan untuk melihat digenea yang menjangkiti ikan ini. Juga telah diperhatikan bahawa, jangkitan digenea kepada spesis ini tidak bergantung kepada panjang ikan.
