PENGAKUAN DAN PENGESAHAN LAPORAN PROJEK ILMIAH I DAN II

Adalah ini diakui dan disahkan bahawa laporan ilmiah bertajuk: The Study of Prevalence and Mean Intensity of Endoparasite (Digenea) on *Thunnus obesus* (Bigeye Tuna) from South China Sea Oleh Nur Aina Lyana Binti Mohamad Ali, No.Matrik Uk13851 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Perikanan dan Akuakultur sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains Agroteknologi (Akuakultur) Fakulti Agroteknologi dan Sains Makanan, Universiti Malaysia Terengganu.

Date : 30 April 2009

ACKNOWLEDGEMENT

In the name of Allah, The Most Gracious and The Most merciful

First of all, I am most grateful to the Allah Al-Mighty for the mercy and bless until I can finish my project and thesis. I would like to express my sincere appreciation and deepest gratitude to my supervisor, Prof Dr. Faizah Shaharom for her supervision, guidance and comments so that my project can be completed smoothly. My appreciation to the Puan Kartini who always help me during my project, for spending time and ideas that her gave to me. Unforgotten, thanks to Anatom and Physiology Laboratory and Biodiversity Laboratory lab assistants for their kindness and cooperation. I am also dedicated special thanks to my beloved parents, Encik Mohamad Ali Che Awang Teh and Puan Rusnani Deris and also my dear siblings for their uncountable supports, advices and courages that raise me up and makes me strong. Last but not least, my appreciation goes to all my beloved friends for their moral support and spirits and also to whom which involved in my project direct or indirectly. Thanks to all.

ABSTRACT

Digenean parasite is one of the parasites that affect marine fishes which cause the fish to be lower in quality and unappealing to eat if the number of parasites is high. Study the parasites on fish can contribute to many aspect includes aquatic pollutants and the migration of fish itself. However, the study on digenea from Tuna in Malaysia is rare. So that I choose this project because tuna is one of fisheries sources in our country. In this study, the prevalence and mean intensity of digenea in bigeye tuna become major aspects. 32 *Thunnus obesus* obtained from South China Sea was dissected to examine digenean parasite from their internal organ. The heart, lymph, pyloric caeca, stomach and intestine was examined under dissecting and compound microscope. All the digenean found was collected and preserved in 70% alcohol in the bijou bottle. The digenea then was stained and drawn under a camera lucida attached to a compound microscope in order to identify the taxonomy of those digenea. The identification was referred to a book written by Yamaguti (1958). The end result shows that 20 *Thunnus obesus* was infected by 2 different digenean parasites known as *Tetrochetus sp.* and *Rhipidocotyle sp.* The prevalence and mean intensity of these digeneans was 62.50% and 6.5 respectively.

ABSTRAK

Digenea merupakan salah satu parasit yang menyerang ikan marin. Ia boleh menyebabkan kualiti ikan menurun dan menyebabkan isi ikan itu tidak sedap untuk dimakan. Kajian tentang parasit pada ikan boleh menyumbang kepada pelbagai aspek kajian lain termasuklah pencemaran akuatik dan migrasi ikan tersebut. Walaubagamapun kajian tentang parasit digenea daripada tuna amat jarang dilakukan di Malaysia. Oleh sebab itu saya memilih permasalahan ini sebagai kajian saya memandangkan tuna merupakan salah satu sumber perikanan penting di Malaysia. Di dalam kajian yang dijalankan ini kelaziman dan keamatian purata menjadi aspek utama. Sebanyak 32 ekor ikan Aya Hitam (*Thunnus obesus*) telah diperiksa di bawah mikroskop pembedahan dan mikroskop cahaya untuk mengkaji kehadiran parasit digenea di dalam organ dalamannya. Digenea – digenea yang ditemui kemudiannya disimpan di dalam alkohol 70 % di dalam botol Bijou. Digenea kemudian diwarnakan supaya organ dalamannya boleh dikenalpasti. Pengenalpastian digenea dibuat mengikut organ dalamannya berdasarkan lakaran daripada lukisan di bawah kamera Lucida yang disambung kepada mikroskop cahaya. Pengenalpastian taksonomi digenea dirujuk kepada buku Yamaguti (1958). Di akhir eksperimen, didapati sebanyak 20 ekor daripada 32 ekor Aya Hitam telah dijangkiti oleh 2 genus digenea yang berbeza iaitu *Tetrochetus* sp. dan *Rhipidocotyle* sp. Kelaziman ikan yang dijangkiti adalah 62.50% manakala purata digenea dalam setiap ikan yang dijangkiti adalah 6.5.
