**DECLARATION AND VERIFICATION REPORT  
FINAL YEAR RESEARCH PROJECT**

It is hereby declared and verified that this research report entitled Identification of Bacteria Isolated on TCBS agar from the White leg shrimp *Litopenaeus vannamei* cultured in the East Coast of Peninsular Malaysia by Shahira bt Ghazali, Matric No. UK25580 have been examined and all errors identified have been corrected. This report is submitted to the School of Marine Science and Environment as partial fulfillment towards obtaining the Degree of Marine Biology School of Marine Science and Environment, Universiti Malaysia Terengganu.

## **ACKNOWLEDGEMENTS**

Firstly, I wish to convey my sincere thanks to my supervisor **Associates Prof. Dr. Yeong Yik Sung** for his enthusiasm guidance and constructive criticism. I am gratefully for his great contribution in designing the experiment and correcting the thesis. I would also like to express a special appreciation to **Madam Wendy Wee** for her support, guidance through the project and kind helps which allows me finish my project and also this thesis. I am also thankful to my co-supervisor **Dr.Kesaven a/l Bhubalan** for his kindness, support, help and advice throughout the project until the preparation of this thesis.

I also wish to convey my special thanks to my Faculty **School of Marine Science and Environmental and Marine Biotech Institute** that allows me to use the laboratories to finish up my project. My deep gratitude is extended to all the members of staff at the faculty and institute that kindly help me with my project. In addition a big thanks to my Final Year Project (FYP) coordinator **Dr. Lee Jenny** for her guidance throughout the process.

I also thank to all my course mates for the friendship, cooperation and support both physically and mentally shared during my period of study in Universiti Malaysia Terengganu (UMT). Last but not least, great thanks to my most meaningful persons in my life, my mom, dad, and my older brother. Their continuous support has been incredible. Thanks for everything. If I failed to include your name above, but you helped me in one way or another, my sincere thanks goes out to you

## ABSTRACT

Diseases such as the Taura syndrome and White Spot Syndrom Disease (WSSV) causes mass mortalities of cultured shrimp worldwide, resulting to severe economic losses. The white leg shrimp *Litopenaeus vannamei* (pacific white leg shrimp) a popular cultured species due their rapid growth, high survival and tolerance to wide range of environmental (Briggs et al., 2004). Nonetheless *L.vannamei* is affected by *Vibrios*, the gram-negative bacteria that cause Vibriosis in shrimp and other crustacean. *V. anguillarum* and *V.harveyi* represent two main *Vibrio* spp found to infect penaeid shrimp. In this study, Thiosulfate citrate Bile Salt Sucrose agar (TCBS) was used to isolate *Vibrio* spp which occur in *L.vannamei* cultured in the East coast of Peninsula Malaysia, work that includes verification of other bacteria that grow on TCBS agar. Six different bacteria species were found on TCBS agar, with their molecular sequence revealing *Bacillus amyloliquefaciens*, *B.thuringiensis*, *B.subtilis*, *Shewanella haliotis*, *Vibrio parahaemolyticus* and *Pseudomonas aeruginosa*.. This observation strongly indicates that bacteria other than Vibrios grow on TSBC agar.

## **ABSTRAK**

**Pengenalan Bakteria diasingkan pada TCBS agar dari Udang Berkaki Putih,**

***Litopenaeus vannamei* Kultur dari Kawasan Pantai Timur Semenanjung**

**Malaysia**

Penyakit seperti sindrom Taura dan White Spot Syndrome telah mengakibatkan kehilangan yang besar dalam industri kultur udang di seluruh dunia. Udang kaki putih, *Litopenaeus vannamei* telah diternak secara meluas di seluruh dunia disebabkan oleh kadar pertumbuhan yang pesat, kelangsungan hidup yang tinggi dan toleransi kepada pelbagai alam sekitar ( Briggs et al. , 2004). Walaupun begitu, *L.vannamei* boleh dijangkit oleh *Vibrios*, bakteria gram- negatif yang menyebabkan Vibriosis kepada udang dan krustasia lain. *V. anguillarum* dan *V.harveyi* mewakili dua spesis bacteria utama yang dijumpai menjangkiti udang penaeid. Dalam kajian ini ‘Thiosulfate citrate-bile salt sucrose’ (TCBS) agar digunakan untuk mengasingkan spesis *Vibrio* yang tumbuh semasa kultur *L.vannamei* dilakukan. Selain itu, bakteria selain daripada *Vibrio* spp yang tumbuh pada TCBS agar juga dikenal pasti. Enam spesis bakteria berbeza telah didapati tumbuh pada TCBS agar , dan dikenal pasti menggunakan ‘molecular sequences’. Spesis yang dikenal pasti antaranya ialah *Bacillus amyloliquefaciens*, *B.thuringiensis* , *B.subtilis* , *Shewanella haliotis* , *Vibrio parahaemolyticus* dan *Pseudomonas aeruginosa*. Penemuan ini menunjukkan bahawa ada bakteria lain selain daripada Vibrios boleh tumbuh di TSBC agar .
