PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

EFFECT OF SHEAR RATE ON THE PERFORMANCE OF PES NANOFILTRATION MEMBRANE oleh NURUL SYAZANA ABDUL HALIM No. Matrik UK 6746 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Kejuruteraan sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah SARJANA MUDA TEKNOLOGI (ALAM SEKITAR), Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

ACKNOWLEDGEMENT

In the name of ALLAH the Most Gracious and Most Merciful

Praise and glory be to ALLAH the Almighty for the gift which has granted me the strength and determination to complete this thesis.

I would like to express my appreciation and gratitude to my supervisor, Dr. Nora'aini Ali for her patience, guidance, invaluable assistance and constructive criticism. Immeasurable gratitude is forwarded to Mr Zul, Mr Razali, Mr Razman, all the lectures and staff in KUSTEM.

I also would like to extend my warmest thanks to my family especially to my mom and dad for their never ending love and support who keep me strong, level headed, and down to earth, to always remember our moral and how to keep our respect..

I am deeply indebted to my course mate (Bryant, Hafidz, Achik, Edwin and Nurliza) and all those who had contributed directly or indirectly not forgetting Wan Mohd Azli who had gives me lots of inspiration and courage.

May ALLAH shower His blessings upon all of us. Thank you.

LIST OF APPENDIX

- A NaCl calibration curve
- B Phenol-hypochlorite reagent
- C Digestion reagents
- D Total phosphorus and total ammonia calibration curve
- E Pure water flux and rejection data for PES NF membrane at shear rate 160s^{-1}
- F Pure water flux and rejection data for PES NF membrane at shear rate 106.7s^{-1}
- G Pure water flux and rejection data for PES NF membrane at shear rate 80s^{-1}
- H Pure water flux and rejection data for PES NF membrane at shear rate 64s^{-1}

ABSTRACT

The objective of this study is to investigate the effect of shear rate on the performance and structure of asymmetric Polyethersulfone (PES) nanofiltration (NF) membrane for aquaculture wastewater treatment. The membrane is fabricated from a ternary composition consisting of Polyethersulfone (PES)/N-methyl-2-pyrrolidone (NMP)/polyvinylvirrolidone (PVP) - (18%/77%/5%) by a simple dry/wet phase inversion process using an electrically controlled flat sheet membrane casting machine. Varying the casting speed (10, 15, 20 and 25) seconds will vary shear rate (160, 106.7, 80 and 64) s^{-1} . The membrane permeability and salt rejection performance were determined based on the pure water flux and sodium chloride solution permeation test. Subsequently, permeation tests of aquaculture waste, taken at a discharged point after sand filtration treatment, from fish pond of Institute Aquaculture & Tropical, KUSTEM were employed. The rejection ability towards Cl^- ions was shown in the following manners: $R_{SR}=160s^{-1} > R_{SR}=106.7s^{-1} > R_{SR}=80s^{-1} > R_{SR}= 64s^{-1}$. The same trend was observed for the removal of total phosphorus case. It could be postulated that, the higher the shear rate the better orientation of polymer molecules in the membrane structure. These findings suggested that the best shear rate casting condition is lying on $160s^{-1}$. Besides, the high percentage of total phosphorus (>96%) obtained shown a great potential of applying nano-membrane technology in aquaculture water and wastewater management.

ABSTRAK

Objektif kajian ini adalah untuk mengkaji kesan kadar ricip ke atas prestasi dan struktur membran penuras nano asimetrik PES untuk rawatan air sisa akuakultur. Membran dibuat menggunakan komposisi campuran tiga bahan iaitu Polietersulfon (PES)/N-metil-2-pyrrolidon (NMP)/polivinilvirrolidon (PVP) - (18%/77%/5%) menerusi kaedah pembalikan fasa kering/basah dengan menggunakan mesin penghasilan kepingan rata elektrik.. Perbezaan laju (10, 15, 20 and 25) saat akan membezakan kadar ricip (160, 106.7, 80 and 64) s^{-1} . Ketelapan membran dan prestasi penyaringan garam ditentukan berdasarkan fluks air tulen dan ujian ketelapan larutan natrium klorida. Berikutnya, ujian ketelapan air akuakultur yang diambil dititik keluar selepas rawatan penapisan di kolam ikan Institut Akuakultur dan Tropika KUSTEM dijalankan. Kebolehan penyaringan terhadap ion Cl^- ditunjukkan dalam keadaan berikut: $R_{SR}=160s^{-1} > R_{SR}=106.7s^{-1} > R_{SR}=80s^{-1} > R_{SR}= 64s^{-1}$. Paten yang sama turut ditunjuk oleh kes penyaringan jumlah fosforus. Dapat di andaikan, lebih tinggi kadar ricip, orientasi molekul polimer dalam struktur membran adalah lebih baik. Penemuan ini turut mengesyorkan kadar ricip yang terbaik adalah pada $160s^{-1}$. Selain itu, peratus penyaringan jumlah fosforus ($>96\%$) yang tinggi menunjukkan peluang yang besar dalam mengaplikasikan teknologi membran penuras nano dalam pengurusan air dan air sisa akuakultur.
