**PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

**SEPARATION OF MONO AND DIVALENT IONS USING ASYMMETRIC
NANOFILTRATION MEMBRANE**

Oleh **EDWIN KEBING MERING**, No. Matrik: **UK 6921** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Kejuruteraan sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Teknologi (Alam Sekitar), Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

Disahkan oleh:

ACKNOWLEDGEMENTS

First of all, I would like to thank God for HIS endless blessing in my life especially in completing my thesis. I would also like to express my deepest gratitude to my main supervisor, Dr. Nora'aini Ali, for all the invaluable guidance, support and constructive criticisms throughout this study. In addition to that, I would like to thank all the lecturers especially to Mr. Asmadi for his support and tolerance as the coordinator for the final project and also as my co-supervisor. Beside that, I would personally like to thank the diligent Mr. Zul, my external supervisor.

I would also like to express my warmest appreciation to all the Department of Engineering Science staffs (Mr. Razman, Mr. Mahmud, Mr. Zaki, Miss Mazalina and Mdm Siti Zulaika) that had been ever helpful and offer me their full cooperation or assistance all the time. Also, it is my pleasure to thank Mr. Nasir from the Institute of Oceanography (INOS) and also Mr. Zali for providing the scanning microscopy electron (SEM) image for this study.

Lastly, I would like to thank my parents and siblings for their love and support and not forgetting all my friends and course mates. It is an honour and a great pleasure indeed to have the opportunity work with you all. God bless and hope all of you to have a successful career and enjoyable life.

ABSTRACT

The aim of this study was to investigate the separation of mono and divalent ions using asymmetric nanofiltration (NF) membranes in different salt solutions (NaCl, Na₂SO₄, NaBr and MgSO₄) with standard concentration of 0.01 M. The separation of mono and divalent ions was important to be studied in understanding the applications of the membrane in industrial applications and water treatment. Asymmetric nanofiltration (NF) membranes were developed by the dry/wet phase inversion method from casting solutions containing 21% polyethersulfone PES as polymer, 72% *N*-methyl-2-pyrrolidone (NMP) as solvent and 7% Poly(vinyl pyrrolidone) (PVP) as additive using a semi automated electrically controlled casting machine. The steric and Donnan effects were two major factors to be considered. The rejection of the each salt solution was measured in order to determine the membrane performance. The permeability of each membrane was determined by measurement of pure water flux as a function of applied pressure. The deviation from the average value of permeability coefficient for all membranes varied between 6-16%. The results obtained were coherent with the theory of separation and transportation of salts for nanofiltration membranes where the membranes were found to be a negatively charge membrane. The rejections of the salts by the membranes were found to decrease in the following sequence: Na₂SO₄ > MgSO₄ > NaCl > NaBr with the rejection range of 52-56%, 36-53%, 23-39% and 14-27% respectively according the rejection sequence. It was postulated that fabricated membranes were considered to be loose NF membranes with moderate negatively charged density.

ABSTRAK

Kajian ini telah dijalankan bertujuan untuk menyelidik pemisahan mono-ion dan dwi-ion menggunakan membran asimetrik penuras nano dalam larutan garam yang berbeza iaitu NaCl, Na₂SO₄, NaBr dan MgSO₄ dengan kepekatan piawai 0.01 M. Kajian mengenai pemisahan mono-ion dan dwi-ion adalah penting untuk dikaji supaya dapat memahami aplikasi di dalam perindustrian dan rawatan air. Membran asimetrik penuras nano disediakan dengan menggunakan kaedah fasa pembalikan basah/kering dengan larutan acuan yang mengandungi 21% polietersulfon (PES) sebagai polimer, 72% *N*-metil-2 pirrolidon (NMP) sebagai pelarut dan 7% polivinilrolidan (PVP) sebagai aditif dengan menggunakan mesin pengacuan elektrik separa automatik. Kesan sterik dan Donnan merupakan dua faktor utama yang perlu ditekankan. Penyingkiran untuk larutan garam dinilai untuk menentukan kecekapan membran. Ketelapan membran ditentukan dengan menentuukur fluks air tulen dengan tekanan yang berbeza. Sisihan ketelapan bagi semua membran adalah dalam julat di antara 6-16%. Hasil kajian yang diperolehi digunakan untuk menentukan keberkesanan atau kecekapan membran dan didapati menepati teori untuk pemisahan larutan garam untuk membran penuras nano dimana membran terhasil seperti dijangka merupakan membran bercas negatif. Penyingkiran larutan garam oleh membran dalam turutan menurun adalah seperti berikut Na₂SO₄ > MgSO₄ > NaCl > NaBr dengan julat penyingkiran 52-56%, 36-53%, 23-39% dan 14-27% masing-masing mengikut turutan penyingkiran disebut. Maka, membran yang dihasilkan diramalkankan sebagai membran longgar dan berliang dengan ketumpatan cas yang sederhana.
