ACKNOWLEDGEMENTS

First, I would like to express my heartiest gratitude and appreciation to my supervisor, Prof. Faizah Sharom Harrison for her guidance and for all the precious times she spent in guiding me throughout the whole project. Without her help and guidance as well as her suggestions, this project would not be completed in given time.

Secondly, I would like to express my thanks to the marine hatchery in-charge person, Mr. Yacoob and his staff as they allow me to conduct the experiments in most organized way and also provided me with all the needed materials.

Not to forget, the director of Pusat Pengembangan Akuakultur, Jitra, Kedah Mr. Adibi Rahiman and officers especially Mr. Muhammed Mehad and Mr.Azam in contributing the fingerlings produced at the center for my project.

Last, but not the least, my fellow friends who guide me, give moral support and also exchange informations gathered in order to complete this thesis.

Finally, thanks to my family members as they supported me financially and emotionally until the project was completed.

ABSTRACT

A study on the effects of treatment of *Piscinoodinium pillulare* infection on Lampam Jawa fingerlings with Copper sulphate was conducted in Marine Hatchery Universiti Malaysia Terengganu from December 2006 to February 2007. In the previous test, 0.08 ppm of copper sulphate calculated as 96-hour LC₅₀ acute toxicity of copper on the fingerlings. Fingerlings infected with this dinoflagellate parasite obtained from Pusat Pengembangan Akuakultur, Jitra, Kedah and treated with copper sulphate within this range for 96 hour. At the end of the experiment, the gills of the fingerlings were dissected out and fixed in 10% buffered formalin for histopathological studies. Histopathology of the infected fish shows that there was hyperplasia in secondary lamella with degeneration and reduced space between secondary lamellas. Histopathology of gills treated with copper sulphate shows that there was a synergistic effects that is there was increased hyperplasia and inflammation in gills of Lampam Jawa infected with *Piscinoodinium pillulare* and exposed to copper sulphate.

ABSTRAK

Satu kajian rawatan jangkitan *Piscinoodinium pillulare* pada benih Lampam jawa dengan kuprum sulfat telah dijalankan di Hatchery Air Masin, Universiti Malaysia Terengganu dari Disember 2006 hingga Februari 2007. Eksperimen yang dijalankan terlebih dahulu telah menunjukkan 0.08 ppm kuprum sulfat sebagai nilai 96 jam LC₅₀ ketoksikan akut kuprum yang boleh digunakan pada benih lampam jawa. Benih Lampam Jawa yang telah dijangkiti dengan parasit dinoflagelat ini diterima dari Pusat Pengembangan Akuakultur, Jitra, Kedah dan telah dirawat dengan kuprum sulfat dengan lima kepekatan dalam julat 0.00 hingga 0.08 ppm. Pada akhir eksperimen, insang dari setiap kumpulan dikeluarkan dan diawet dalam 10 % buffered formalin untuk kajian histopatologi. Kajian histopatologi insang ikan yang dijangkiti parasit menunjukkan bahawa terdapat hyperplasia pada secondari lamella dengan kemerosotan dan kurang ruang antara secondari lamella. Histopatologi insang yang dirawat pula menunjukkan bahawa terdapatnya kesan sinergetik antara insang ikan Lampam jawa yang dijangkiti dengan *Piscinoodinium pillulare* dan didedahkan kepada kuprum sulfat dimana hyperplasia and inflamasi jelas kelihatan.
