DEDICATION:

THIS THESIS IS DEDICATED TO ALL PEOPLE WHO IS INTERESTED IN
REMOTE SENSING STUDIES AND SPEACIALLY TO MY PARENTS,
BROTHERS, SISTERS AND NOT TO FORGET TO MY DEAREST ONE WHO
ALWAYS LENDING ME A HAND. THANK YOU FOR ALL OF YOUR
SUPPORTS AND ENCOURAGEMENTS.

ACKNOWLEDGEMENT

بسم الله الرحمن الرحيم

“In the name of Allah, Most Gracious and Most Merciful”

I am grateful to Almighty who has given the full blessings for me to finish this final project. My thanks go foremost to beloved mother, Madam Wan Rahimah, my father, Mr Ramli and my wonderful siblings who always supported me.

I would like to take this opportunity to thank to my best supervisor Mr Mohd Suffian b Idris for his guidance and in helping me to accomplish this project. I am grateful to him as he always gives many comments and suggestions that helped me a lot. In fact, I would like to thank him especially for his patience, caring and understanding personality.

Besides that, I would like to thank Mr Nasir and my colleagues who helped me during the sampling. Not to forget to my friends, my coursemates and those who helped directly and indirectly. Many of you people, thank you a lot!

Chapter 1: INTRODUCTION

1.1	Background of study	1
1.1.1	Coastal waters	1
1.1.2	Classification of coastal waters	1
1.1.3	In-water optical properties	2
1.2	Importance of study	3
1.3	Objectives	4

Chapter 2: LITERATURE REVIEW

2.1	Remote sensing reflectance	6
2.2	Diffuse attenuation coefficient	7
2.3	Suspended solids	9

Chapter 3: METHODOLOGY

3.1	Description of study areas	10
3.2	In situ measurement	11
3.2.1	Water sample collection	11
3.2.2	Radiometric measurement	11
3.3	Water analysis	12
3.4	Data analysis	12

Chapter 4: RESULT

4.1	The observation of sky condition	14
4.2	Hydrographic measurement	16
4.3	Water clarity	18
4.4	TSS Concentration	20
4.5	Remote Sensing Reflectance	22
4.6	Diffuse attenuation coefficient	28
4.7	Relationship between AOP and TSS concentration	33
4.7.1	Reflectance versus TSS concentration	33

4.7.2 Diffuse attenuation coefficient	38
Chapter 5: DISCUSSION	44
Chapter 6: CONCLUSION	49

LIST OF ABBREVIATIONS

SYMBOL	DEFINITION
AOP	Apperent Optical Properties
CDOM	Coloured Dissolved Organic Matter
$E_d(0^+, \lambda)$	Incident irradiance
$E_d(0^-, \lambda)$	Downwelling irradiance
IOP	Inherent Optical Properties
K_d	Diffuse attenuation coefficient
$L_u(0^+, \lambda)$	Upwelling radiance on surface
$L_u(0^-, \lambda)$	Upwelling radiance below surface
$L_w(\lambda)$	Water leaving reflectance
NTU	Nephelometric Turbidity Unit
PAR	Photosynthetic Active Radiance
R_{rs}	Remote sensing reflectance
$R_{rs}(\%)$	Percentage Remote sensing reflectance
TSS	Total Suspended Sediment
[TSS]	Concentration of TSS
z	Depth (m)
ρ	Fresnel reflectance index of seawater (0.021)

η_w

Fresnel refractive index of seawater
(1.345)

α

Fresnel reflection albedo of sun and sky
(0.043)

ABSTRACT

The field of remote sensing can be used to determine the distribution of different types of constituents in seawater such as chlorophyll-a, Coloured Dissolved Organic Matter (CDOM) and Total Suspended Sediments (TSS). In this research, the measurements of Apparent Optical Properties (AOP) parameters such as R_{rs} and K_d have been conducted and their relationship with TSS were investigated. 22 stations along Kuala Terengganu coastal waters were chosen as the sites of study. The in-situ observations were carried out between 14th and 17th of September 2006. The in-situ data of radiometric measurements ($E_d(0^+)$ and $L_u(0^+)$) were processed using the Prosoft 7.78 software to derive AOP parameters (R_{rs} and K_d). For each station, water samples were collected to measure the concentration of TSS. The regression analyses were done between the concentration of TSS and AOP parameters in order to determine the relationship between them. The regression analysis revealed that the TSS can be best estimated at 675 nm wavelength of R_{rs} and 532 nm wavelength of K_d . Results obtained suggest that in-situ measurement of AOP parameters are potentially valuable to develop site-specific algorithms for estimating TSS concentration through remotely sensed optical data.

ABSTRAK

Bidang penderiaan jauh boleh digunakan untuk menentukan pelbagai konstituen yang terdapat dalam air laut seperti taburan klorofil-a, Bahan Organik Terlarut (CDOM) dan Jumlah Pepejal Terampai (TSS). Dalam kajian ini, pengukuran parameter Ciri-ciri Optik Nyata (AOP) seperti Pantulan Penderiaan Jauh (R_{rs}) dan Pekali Pelemahan Cahaya (K_d) telah dilakukan dan hubungan antara kedua-duanya dengan kepekatan TSS dikaji. 22 stesen di perairan Kuala Terengganu telah dipilih sebagai kawasan kajian ini. Pemerhatian ‘in-situ’ dijalankan antara 14 dan 17 September 2006. Data ‘in-situ’ pengukuran radiometrik ($E_d(0^+)$ dan $L_u(0^+)$) diproses menggunakan perisian Prosoft 7.78 untuk mendapatkan parameter AOP (R_{rs} and K_d). Sampel air bagi setiap stesen telah diambil untuk mengetahui kepekatan TSS yang terdapat di dalam air laut. Kemudiannya, analisis regresi dilakukan antara kepekatan kandungan TSS di dalam air dan data parameter AOP untuk mencari perhubungan antara kedua-duanya. Analisis regresi menunjukkan TSS dapat ditentukan pada 675 nm panjang gelombang untuk R_{rs} dan 532 nm panjang gelombang untuk K_d . Keputusan yang diperolehi dapat menerangkan bahawa pengukuran ‘in-situ’ parameter AOP berpotensi untuk menghasilkan ‘site-specific algorithms’ dalam menentukan kepekatan TSS melalui data optik secara penderiaan jauh.
