This project report should be cited as:

Pek, Y. L. 2012. A study on coral reef mapping by using remote sensing technology around Lang Tengah Island, Terengganu. Undergraduate thesis, Bachelor of Science in Marine Science, Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu, Terengganu, 55p.

No part of this project report may be reproduced by any mechanical, photography, or electronic process, or in the form of phonographic recording, nor may it be stored in a retrieval system, transmitted, or otherwise copied for public or private use, without written permission from the author and the supervisor(s) of the project.

DECLARATION AND VERIFICATION REPORT

FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled:

A Study of Coral Reef Mapping by Using Remote Sensing Technology Around Lang Tengah Island, Terengganu by Pek Yen Lee, Matric No. UK20341 have been examined and all errors identified have been corrected. This report is submitted to the Department of Marine Science as partial fulfillment towards obtaining the Degree of **Bachelor of Science (Marine Science)**, Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

First of all, I feel grateful to my supervisor, Prof. Madya Dr. Ady @ Mohamed Shawal bin M. Muslim for his guidance, attention and also his patient. Without his advices, this project might not have been completed in time. Besides, I also give my appreciation to my co-supervisor, Dr. Razak Zakariya for willing accepts me as his student.

I would like to take this opportunity to express my sincerest gratitude and deepest thanks to Encik Kaharudin B. Mat Zin and Encik Naieman bin Muhamad of Oceanography Institute (INOS) whose guide and help me a lot during I analyze my project. Thank you also to my course mate, Nur Hidayah Ngadiman and Teow Boon Shyan by helping me during the processing data of my project.

Besides that, my grateful also reach out to my friends for their companion, care, motivation and support within these three years studies. Special thanks to Goh Wei Sin, Aw Pei Rui and Sim Eik Ee for accompany me during the hardships period when during this project. Finally, I would like to extend my appreciation to my beloved family for their supports during my days in pursuing my degree in Marine Science at UMT.

ABSTRACTS

Coral reefs are unique ecosystem that brings a lot of benefits to the environment and even thought to human beings. However, most of the coral reefs ecosystem had been threatened, exploitation and destroyed. Hence, monitoring and management is very important to understand and know the distribution of coral reefs. This study was conducted at Lang Tengah Island, Terengganu to monitor the coral reefs distribution around the island. QuickBird Image was used as it has fined spatial resolution which suitable for benthic habitats mapping. The mapping processes were done by using unsupervised and supervised classification. Maximum Likelihood classification, Parallelepiped classification and Minimum Distance to Means classification had been used for the supervised classification. Besides, comparison these 3 classifications within 3 bands (Red, Green and Blue Bands) had done. The Band 2 is the optimum band for benthic habitats study with the accuracy of 92% by Kappa Coefficient accuracy assessment. Among three classification algorithm, Maximum Likelihood Classification is the most accurate than others. Further studies of coral reefs mapping are essential to carry on time to time for future knowledge about the coral reef distribution at Lang Tengah Island.

Kajian Terhadap Pemetaan Terumbu Karang Dengan Menggunakan Teknik Penderiaan Jauh di Sekitar Pulau Lang Tengah, Terengganu

ABSTRAK

Terumbu Karang adalah ekosistem yang sangat unik dan ianya telah membawa pelbagai faedah kepada alam sekitar dan begitu juga terhadap manusia sendiri. Namun begitu, kebanyakan terumbu karang telah kian diancam, diterokai dan dimusnahkan. Justeru itu, pemantauan dan pengurusan terumbu karang adalah sangat penting untuk mengetahui pertaburan terumbu karang. Kajian telah dijalankan di Pulau Lang Tengah, Terengganu untuk pemetaan taburan terumbu karang disekitarnya. Gambar satelit QuickBird telah digunakan dalam kajian ini disebabkan ia mempunyai spasial resolusi yang tinggi dan sesuai untuk pengelasan atau pemantauan dengan habitat bentos. Pemetaan taburan terumbu karang dijalankan dengan pengelasan tanpa pengawalan dan pengelasan secara pengawalan. Pengelasan secara pengawalan terbahagi kepada teknik kemungkinan maksimum, pengelasan parallelepiped dan juga pengelasan minimum jarak kepada min telah digunakan untuk pemetaan taburan terumbu karang. Selain itu, 3 band (merah, hijau dan biru) telah digunakan untuk mengkaji perbezaan ketepatan yang paling sesuai untuk kajian ini. Band 2 adalah band yang paling jitu untuk kajian ini iaitu mencapai 92% daripada pengiraan pekali Kappa. Daripada 3 cara pengelasan, teknik kemungkinan maksimum adalah teknik pengelasan yang paling tetap berbanding dengan yang teknik yang lain. Kajian selanjutnya haruslah dijalankan untuk memastikan taburan terumbu karang adalah terlindung.
