ACKNOWLEDGEMENTS

First of all, thanks to God cause gave strength to me until I had finished my final year project. A lot of challenged and difficulties that I had been through during the completion of this project. Beside that, all this matters was trained me to be more creative, proactive and patient in terms of problem solving. For my supervisor, Dr. Razak Bin Zakariya, I am deeply indebted to him for his guidance, support and encouragement throughout the process of the project.

I would like to express my gratitude to all those who hepled me to complete this project especially to Mr. Muhammad Taufiq Bin Abu Bakar, cause dedicated his time to guide me and give helpful advice and opinion. A lot of thanks also to all staff and master students at lab of remote sensing and GIS, Universiti Malaysia Terengganu caused give me hand and coorperation during completion of this project.

Finally, especially to my lovely family, sincerely thanks to them for their continuous support of moral and belief in me which helped me get through to this project. Last but not least, I would to thanks all my friends who give me a lot of support to complete my project on time. I belief without all of them, I would not be here today.

ABSTRACT

The study was conducted in order to determine the temporal and spatial land cover changes from year 2000 to year 2010 at Pahang river catchment area using remotely sensed data GIS. The combination of satellite data and GIS give an advantage in determination of the changes and also as a tool for monitoring the environmental impact on study area. Landsat ETM+ (2000) and Landsat TM (2010) images were classified using the maximum likelihood classifier to produce the land cover map for each year. The land cover map for both year were then overlay to detect the changes. Seven types of land cover were produced for each land cover map which are forest, palm oil, rubber, cropland, mangrove, rural and open land area. Between 2000 and 2010, the forest area was declined by 1776 km² and covered 57.9 % of total land cover in study area. The area of rubber plantation also showed the declined over the past ten years to become 4586 km² from 4921 km² in area. Mostly area of rubber was converted into palm oil plantation and represent about 73.7 % of total loss of rubber area. Cropland and mangrove covers declined from 625 km² and 76 km² in 2000 to 578 km² and 46 km² in 2010 respectively. Palm oil plantation in the study area experienced the increasement from 4443 km² in 2000 to be the second highest land cover type in catchment area, which is 6256 km² in 2010. The study highlights the importance of integrating remotely sensed and local knowledge to generate the information that could be used to overcome the catchment management problem.

SATU KAJIAN TENTANG PERUBAHAN LITUPAN TANAH DI KAWASAN TADAHAN SUNGAI PAHANG DENGAN MENGGUNAKAN PENDERIAAN JAUH DAN SISTEM INFORMASI GEOGRAFI

ABSTRAK

Kajian ini dijalankan untuk menentukan perubahan litupan tanah dari segi masa dan tempat daripada tahun 2000 sehingga tahun 2010 di kawasan tадahan sungai Pahang dengan menggunakan teknologi penderiaan jauh dan GIS. Gabungan data satelit dan GIS memberikan kelebihan dalam menentukan perubahan dan juga sebagai alat untuk memantau kesan alam sekitar di kawasan kajian. Imej daripada satelit Landsat ETM+ (2000) dan Landsat TM (2010) telah dikelaskan menggunakan pengelasan kemungkinan yang maksimum untuk menghasilkan peta litupan tanah bagi tahun 2000 dan 2010. Seterusnya dengan menggunakan teknologi daripada GIS, kedua-dua peta litupan tanah ini akan ditindaklanjuti untuk melihat kawasan litupan yang mengalami perubahan sepanjang 10 tahun itu. Tujuh jenis litupan tanah telah dikelaskan untuk setiap peta tersebut, iaitu hutan, kelapa sawit, kawasan tanaman getah, tanah pertanian, bakau, kawasan penduduk dan juga kawasan terbuka. Antara tahun 2000 hingga 2010, jumlah kawasan hutan dikawasan kajian telah mengalami penurunan sebanyak 1776 km^2 yang mana kawasan hutan meliputi 57.9 % daripada keseluruhan kawasan litupan tanah di kawasan kajian. Kawasan penanaman pokok getah juga mengalami penurunan sebanyak 332 km^2 sepanjang 10 tahun untuk menjadikan jumlah keseluruhan kawasan tanaman tersebut sebanyak 4589 km^2 pada tahun 2010 berbanding 4921 km^2 10 tahun sebelumnya. Turut mengalami penurunan ialah kawasan pertanian dan kawasan bakau, masing-masing

menurun sebanyak 47 km^2 dan 31 km^2 untuk tempoh 10 tahun. Pembangunan pesat dikawasan kajian menjadi faktor kepada peningkatan jumlah kawasan penempatan yang mana bertambah sebanyak 164 km^2 untuk menjadi keluasan keseluruhan sebanyak 324 km^2 pada tahun 2010. Faktor ekonomi juga menyebabkan pertambahan keluasan kawasan penanaman kelapa sawit sepanjang 10 tahun ini, daripada 4443 km^2 pada tahun 2000 menjadi 6256 km^2 10 tahun kemudian. Kajian ini menggambarkan kepentingan integrasi antara teknologi penderiaan jauh dengan pengetahuan tempatan untuk menghasilkan suatu sumber maklumat yang mana ianya mungkin berguna untuk mengatasi masalah berkenaan pengurusan kawasan tадahan ini.
