ACKNOWLEDGEMENTS

Assalamualaikum and first and for most I thank the Almighty God for His Mercy, Guidance and Blessing because giving me the ability to complete and finish my final year project thesis entitled “The distribution and concentration of organochlorine pesticide in aquaculture cage-culture area of Setiu lagoon, Terengganu”. Hopefully with the completion of this thesis will assist and becomes a reference to other fellow students in completing their final year project report.

First of all, I would like to give my sincere thanks to my supervisor, Prof. Madya Dr. Mohamed Kamil bin Abd.Rashid and second supervisor Dr. Nor Antonina binti Abdullah for his enthusiasm, his inspiration, and his great efforts through to its final completion. I would also like to thank to science officer, En. Sainol Aimi bin Saidin and laboratory assistants for their valuable help.

Most importantly, I wish to thank my parents, Mamat bin Ismail dan Mek Nik binti Mohd. They have always supported and encouraged me to do my best in all matters of life. I wish to thank my entire extended family for providing a loving environment for me, guidance and helpful advice.

Finally, much appreciation and thanks goes to my friends Nini, Anis, Fida, Ida and others who contributed much in this thesis. They are so many that I simply could not mention them all. This dissertation would not have been possible without the help and support of them. Great thanks to all.

ABSTRACT

The concentrations of sixteen compound of organochlorine pesticide (OCPs) were measured in the surface sediment and *Crassostrea sp.* collected from the aquaculture cage-culture area of the Setiu lagoon. The sampling was done two times in August 2007 during dry-season (Pre-monsoon) and beginning of the rainy season (monsoon) at November 2007. Sediment and oyster, samples were extracted using solid-liquid technique and pesticides determination using gas chromatography with electron capture detector (GC-ECD). The concentration of OCPs in the sediment during first sampling and second sampling were ranged $0.003\text{-}39.71 \text{ ng g}^{-1}$ and $0.27\text{-}192.74 \text{ ng g}^{-1}$ respectively. Meanwhile, for the *Crassostrea sp.* the total range concentration during first sampling was $0.03\text{-}434.33 \text{ ng g}^{-1}$ and for the second sampling was $0.001\text{-}28.80 \text{ ng g}^{-1}$ respectively. The OCPs compound fall into three major group mainly BHC, Cyclodiene and DDT. Each group had a different concentration for every station. The concentration of Cyclodiene group was higher compare to other groups. The concentration of OCPs was significant in the sediment between the dry-season and beginning at the rainy season (Anova ($p<0.05$)). As a conclusion, the concentration of OCPs in sediments and *Crassostrea sp.* for the both sampling was in the lowest concentration and not polluted.

**TABURAN DAN KEPEKATAN ORGANOKLORIN PESTICIDE DI DALAM
KAWASAN AQUACULTURE SANGKAR TERAPUNG DI SETIU LAGOON,
SETIU TERENGGANU**

ABSTRAK

Kepekatan enam belas jenis organoklorin pesticide (OCPs) ditentukan di dalam sedimen dan oyster yang diambil daripada kawasan akuakultur sangkar terapung di Setiu Wetland lagon. Persampelan telah dilakukan sebanyak dua kali iaitu pada Ogos 2007 ketika musim kering dan pada November 2007 ketika permulaan musim hujan. Sampel sedimen dan *Crassostrea sp.* diekstrak menggunakan teknik solid-liquid dan kepekatan pesticide ditentukan dengan menggunakan gas chromatography bersama pengesan electron (GC-ECD). Kepekatan OCPs di dalam sedimen semasa persampelan pertama dan kedua adalah masing-masing diantara $0.003\text{-}39.71 \mu\text{g g}^{-1}$ dan $0.27\text{-}125.63 \mu\text{g g}^{-1}$. Manakala, untuk *Crassostrea sp.* jumlah kadar kepekatan OCPs semasa persampelan pertama adalah $0.02\text{-}434.33 \mu\text{g g}^{-1}$ dan untuk persampelan kedua adalah $0.001\text{-}22.71 \mu\text{g g}^{-1}$. Kompoun OCPs boleh dibahagikan kepada tiga kumpulan besar iaitu BHC, Cyclodiene dan DDT. Setiap kumpulan mempunyai kepekatan yang berbeza bagi setiap station di dalam kawasan kajian. Kandungan kepekatan kumpulan Cyclodiene merupakan paling tinggi berbanding kumpulan lain. Kepekatan OCPs ada terdapat perbezaan di dalam sediment diantara musim kering dan permulaan musim hujan (Anova: ($p<0.05$)). Sebagai kesimpulan, kepekatan OCPs di dalam sedimen dan *Crassostrea sp.* berada dalam kepekatan yang rendah dan tidak tercemar.
