**PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

Distribution of Mercury in Sediment of Coastal Water of Kuala Terengganu oleh Farizan binti Ahmad, No.Matrik UK11892 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Marin sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Marin), Fakulti Pengajian Maritim dan Sains Marin, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENT

Alhamdulillah, thanks to Allah for His blessing finally I have complete this thesis.

My sincere gratitude and appreciation to my supervisor, Associate. Prof.Dr.Mohamed Kamil Bin Abd.Rashid. He has helped me a lot in my research. Through his guidance, patience and encouragement, I have come this far. Thank you Dr. Not forgets to Dr.Nor Antonina Binti Abdullah, I would like to thank her for encouragement throughout my studies.

I also would like to lend my special thanks to master science student, Kak Aida, who always assisted me along this research. My gratitude also goes to other lab mates and friends Izza, Chikane and Fatima. Special thanks to all oceanography lab assistants like En.Sulaiman, En.Raja, En.Kamarun and En.Kamari for their cooperation. Not forgets to En.Kassim, En.Taro and all Net Loft staff. To other friends who has enriched my life with their friendship and kindness. May Allah bless all of you.

My profound gratitude and love to both of my beloved father and mother for their unconditional love and support. Thank you also to my siblings and family for their encouragement. I am blessed having you all in my life.

ABSTRAK

Kandungan kepekatan merkuri dikaji dalam sedimen perairan Kuala Terengganu yang meliputi kawasan Marang ke Merang. Kepekatan merkuri juga dikaji didalam tisu otot ikan. 9 sampel sedimen dan sampel biota dijalankan dengan menggunakan Plasma Induktif Berganda- Jisim Spektrometer. Kandungan merkuri dalam sedimen dalam julat $0.003\mu\text{gg}^{-1}$ hingga $0.064\mu\text{gg}^{-1}$ sementara untuk tisu ikan ialah $0.014\mu\text{gg}^{-1}$ hingga $0.068\mu\text{gg}^{-1}$. Kepekatan merkuri menunjukkan korelasi rendah dengan min partikel saiz ($r = 0.358$) dan korelasi pertengahan dengan kandungan organik karbon. Berdasarkan keputusan yang diperolehi, hanya satu sahaja kawasan kajian dianggap tercemar dan melebihi nilai min kerak bumi ($0.04\mu\text{gg}^{-1}$) dengan nilai $0.064\mu\text{gg}^{-1}$. Keseluruhannya, stesyen lain mempunyai taburan merkuri pada nilai biasa dalam sedimen. Kandungan merkuri dalam tisu ikan juga dianggap rendah berbanding nilai piawai $0.5\mu\text{gg}^{-1}$ berat basah yang ditentukan oleh Akta Makanan Malaysia. Data yang diperolehi menunjukkan tiada ancaman yang berbahaya kepada kesihatan berlaku di perairan Kuala Terengganu.

ABSTRACT

The concentration of mercury was studied in sediment of coastal water of Kuala Terengganu that covers from Marang to Merang. In fish tissue muscle the concentration was also determined where 9 sample of sediment sample and biota sample were analyzed by ICP-MS (Inductive Couple Plasma – Mass Spectrometer). Mercury content in sediment varied from $0.003\mu\text{gg}^{-1}$ to $0.064\mu\text{gg}^{-1}$ while for the fish tissue is $0.014\mu\text{gg}^{-1}$ to $0.068\mu\text{gg}^{-1}$. Mercury concentration showed low correlation with mean particle size($r = 0.358$) and moderate correlation with organic carbon content ($r = 0.599$). Due to the result obtained, only one sampling site of study area is contaminated and exceeded mean natural value in earth crust ($0.04\mu\text{gg}^{-1}$) with the value is $0.064\mu\text{gg}^{-1}$. Overall, other station has mercury concentration that distributed in the natural value of mercury in sediment. Mercury content in the fish tissue also considered low within the standard of $0.5\mu\text{gg}^{-1}$ wet weight set by the Malaysian Food Act. The data indicated that no major threat to public health occur in coastal water of Kuala Terengganu.
