**PENGAKUAN DAN PENGESAHAN LAPORAN  
PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

Estimation of Chlorophyll-a Concentration from In-Situ Spectral Signatures (remote sensing reflectance,  $R_s$  and normalized water leaving radiance,  $L_{wn}$ ) in Kuala Terengganu Coastal Waters oleh Nadzirah Bt Md Nor, No.Matrik UK 12197 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Marin sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Samudera), Fakulti Pengajian Maritim dan Sains Marin, Universiti Malaysia Terengganu.

## ACKNOWLEDGEMENT

By the name of Allah the almighty and merciful, firstly, I would like to thank God with Allah kindness, I finally be able to finish my final year project in order to fulfill the requirement for the degree of Bachelor of Science (Marine Science). I also would like to thank my beloved supervisor, En. Mohd Suffian Bin Idris for all his advices, critics, guides and motivation in order to give me the best guideline for this project. Not to forget, Dr. Razak Bin Zakariya for his willingness to accept me as my second supervisor in my final year project. My special thanks to my beloved parents, Md Nor Bin Hasan and Nordiah Binti Morat who never fail to support me in aspect of spiritual and financial during my studies in University Malaysia Terengganu. Not to forget, my sisters(Nurasyidah, Nur 'Atiqah) and brothers (Muhd Asri, Muhd Rusdi, Muhd Ammar) for their encouragement in my studies. My special thanks also to my special friend, Izzuddin Bin Sulaiman for his support, advices and always comforts me in my tough period. Furthermore, I also would like to thank all master's students, especially Nurul Adila Binti Hj Rohailan, who never fails to guide and help me to solve problems in finishing this thesis. For the last but not least, I would like to thank all laboratory assistances, all marine science third year students and special thank goes to Noor Fadhilah Abdullah, Hazwani Mohd Said, Nurul Aisyah Yasin and Farah Adilla Raden Mohd Fuad as my final year project mates for their help and support. Only Allah can repay all of your kindness.

## ABSTRAK

Kajian tentang penilaian ciri-ciri optik nyata dan hubungannya dengan Klorofil-a telah dijalankan di sekitar perairan Kuala Terengganu. Kajian ini dijalankan bagi mengetahui ataupun menganggar kepekatan klorofil dan hubungkaitnya dengan parameter radiometer iaitu Rrs dan Lwn. 28 buah stesen telah dikaji di sepanjang perairan Kuala Terengganu iaitu bermula pada 23 Oktober 2007 hingga 27 Oktober 2007. Dalam kajian, parameter radiometer AOP seperti sinaran pusuan naik dan pekali pelemahan peresapan diukur di kawasan lapangan. Kepekatan klorofil yang paling tinggi di kawasan kajian adalah  $0.4741 \text{ mg/m}^3$  iaitu pada stesen 28. Didapati juga klorofil-a dapat diukur dengan menggunakan nilai Rrs pada panjang gelombang 673 melalui hubungan polinomial dengan nilai regresi 0.7333 manakala dapat juga dilihat klorofil-a juga dapat diukur dengan menggunakan nilai Lwn pada panjang gelombang 656 melalui hubungan polinomial dengan nilai regresi 0.6264.

## ABSTRACT

The study of the apparent optical properties and its relationship with chlorophyll-a were conducted in coastal water of Kuala Terengganu. This study was carried-out in order to estimate the the chlorophyll concentration from in situ spectral signature ( $R_{rs}$  and water leaving radiance,  $L_{wn}$ ) around Kuala Terengganu coastal waters. Twenty eight stations are visited. The ground sampling was conducted from 23 October 2007 until 27 October 2007. In this study, AOP radiometric parameter such as upwelling radiance, remote sensing reflectance and water leaving radiance have been measured during in situ. Highest concentration of chlorophyll-a was observed in the study area was  $0.4741 \text{ mg/m}^3$  at station 28. The study found that chlorophyll-a can be estimated using the Rrs at 673nm wavelength through polynomial relationship with regression 0.7333 while study also revealed that chlorophyll-a can be estimated using the Lwn at 656nm wavelength through polynomial relationship with regression 0.6264.
