**DECLARATION AND VERIFICATION REPORT
FINAL YEAR RESEARCH PROJECT**

It is hereby declared and verified that this research report entitled: **Performance Of Aluminium Alloy In Seawater Using Various Concentration Of Tapioca Starch** by **Maisara Binti Zakarya**, Matric No. UK 21435 have been examined and all errors identified have been corrected. This report is submitted to the Department of Maritime Technology as partial fulfillment towards obtaining the **Bachelor Degree of Applied Science (Maritime Technology)**, Faculty of Maritime Studies and Marine Science, Unitversiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

At the end of my thesis, I would like to express the deepest appreciation to people that help and supports me with new knowledge and good information to produce this good thesis. I would like to thanks my first supervisor, Prof. Madya Dr. Wan Mohd. Norsani bin Wan Nik that continually gives me a lot of encouragement and help me during this project. The ideas and knowledge given and shared really help me to improve my thesis. Also thanks to Dr. Ahmad Faisal Mohamad Ayob as my second supervisor for giving me tips and advices during experiment held.

A lot of appreciate to Mr. Fakhratul Ridwan Zulkifli that guided me from the begining of my thesis. The suggestions given really help me and my thesis works smoothly. The information and experience while conducting his final year project was shared with me and improves me better. He helps me a lot by explained the steps of the procedures during handling my thesis.

Not to forget also, I would like to thank my friends especially Adibah Husna and Noor Farahidah that help me a lot accompany me for laboratory measurement. Thanks also to my friends that conducting the same corrosion experiment and shared the knowledge together. New enjoyable experience was shared together while monitoring this laboratory measurement. Last but not least, my beloved family is really supportive and understanding that always motivates me to finish my thesis. They always be my side and pray for my successful.

PERFORMANCE OF ALUMINIUM ALLOY IN SEAWATER USING VARIOUS CONCENTRATION OF TAPIOCA STARCH

ABSTRACT

Currently, there are many studies about the use of inhibitors for the control of corrosion of metals and alloys which are in contact with aggressive environment. It is need to point out the importance of cheap and safe inhibitor of corrosion. Therefore, inhibitors that are from natural sources have become important as they are environmentally acceptable, readily available and renewable sources. Aluminium was chosen as experimental material because it is widely used for many applications in engineering material as it has many advantages. This study used tapioca starch because it offers interesting possibilities for corrosion inhibitor and it is safe to use, low cost, availability, and high solubility in seawater. Low concentration of tapioca starch which is 200, 400, 600, and 800ppm was used. The characterization of the corrosion was performed by using weight loss, potentiodynamic polarization (PP), electrochemical impedance spectroscopy (EIS), fourier transform infrared spectroscopy (FTIR) and scanning electron microscope (SEM). The percentage of inhibition efficiency (IE %) was calculated by using equation and this study showed the corrosion rate decrease by increasing concentration of the tapioca starch. Tapioca starch used is believed to form a surface layer as it protects AA5083 from reacting to the environment. This is confirmed by doing analysis of SEM that show the formation of precipitates of tapioca starch on the metal surface, which reduced the overall corrosion reaction.

PRESTASI ALUMINIUM ALOI DALAM AIR LAUT MENGGUNAKAN PELBAGAI KEPEKATAN KANJI UBI KAYU

ABSTRAK

Pada masa ini, terdapat banyak kajian tentang penggunaan perencat untuk mengawal kakisan logam dan aloi yang berada dalam hubungan dengan persekitaran yang agresif. Ia adalah perlu untuk menunjukkan kepentingan perencat yang murah dan selamat terhadap kakisan. Oleh itu, perencat yang berasal daripada sumber semula jadi adalah penting kerana mereka diterima alam, merupakan sumber-sumber yang sedia ada dan boleh diperbaharui. Aluminium telah dipilih sebagai bahan eksperimen kerana ia digunakan secara meluas untuk banyak aplikasi dalam bahan kejuruteraan kerana ia mempunyai banyak kelebihan. Kajian ini menggunakan kanji ubi kayu kerana ia menawarkan kemungkinan yang menarik untuk perencat kakisan dan ia adalah selamat untuk digunakan, kos rendah, ketersediaan, dan keterlarutan dalam air laut yang tinggi. Kepekatan kanji ubi kayu yang rendah iaitu 200, 400, 600, dan 800ppm telah digunakan. Pencirian kakisan diuji dengan menggunakan kehilangan berat, pengutuban potentidinamik (PP), spektroskopi impedans elektrokimia (EIS), alat Fourier Transform Infrared Spectroscopy (FTIR), dan alat spectroscopy impedance microscope (SEM). Peratusan kecekapan perencatan (IE%) telah dikira dengan menggunakan persamaan dan kajian ini menunjukkan penurunan kadar kakisan dengan peningkatan kepekatan kanji ubi kayu. Kanji ubi kayu yang digunakan dipercayai membentuk lapisan permukaan kerana ia melindungi AA5083 daripada bertindak balas kepada persekitaran. Ini disahkan dengan melakukan analisis SEM yang menunjukkan pembentukan mendakan kanji ubi kayu pada permukaan logam, yang mengurangkan tindak balas kakisan keseluruhan.
