DECLARATION AND VERIFICATION REPORT
FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled: **Effect of Henna in Ethyl Acetate for the Inhibition of Aluminium in Seawater at Low Concentration** by **Siti Nurul Ummini binti Kosen**, Matric No. **UK 19921** have been examined and all errors identified have been corrected. This report is submitted to the Department of Maritime Technology as partial fulfillment towards obtaining the **Bachelor Degree of Applied Science (Maritime Technology)**, Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

At the end of my thesis, I would like to express my sincere gratitude to all those who made this thesis possible and creating an enjoyable experience for me. Firstly, I would like to thank my supervisor Prof. Dr. Wan Mohd. Norsani bin Wan Nik who helped me a lot and gave me inspiration and motivates me during conducting this research. Also thanks to Mr.Ir. Ferry Manuhutu as my second supervisor for giving me tips and advices during experiment held.

Next, I would like to thank to my senior which is now doing as a Research Assistant, Mr. Mohammad Fakhratul Ridwan bin Zulkifli who help me a lot in conducting this research.

Not to forget also, I would like to express my prevalent gratitude to my beloved family for supporting me before, during and after conducting this research. Lastly, I would like to thank all of my friends especially those who were involved conducting corrosion research together and to my other fellow friends including my housemate who always cheering me up during this research.

EFFECT OF HENNA IN ETHYL ACETATE FOR THE INHIBITION OF ALUMINIUM IN SEAWATER AT LOW CONCENTRATION

ABSTRACT

Aluminium is an important subject of research because it is abundant in nature easy to handle. Nowadays, corrosion is entrenched in maritime industry where the ship plate undergoes corrosion and it depends on the different environment. This study investigates the inhibition performance of henna towards AA5083 in seawater. The characterization of the corrosion was performed by using fourier transform infrared spectroscopy (FTIR), weight loss, electrochemical impedance spectroscopy (EIS), potentiodynamic polarization (PP), and scanning electron microscope (SEM). The inhibition efficiencies (IE%) for all measurement obtained from different method; weight loss, polarization resistance (R_p), corrosion current density (I_{corr}) and corrosion rate are in good agreement where the highest inhibition efficiencies (IE%) is 83.84% at 500ppm after 60 days of immersion. The value for charge transfer resistance (R_{ct}) increase as a result of increasing in the degree of protection of AA5083 in test solution and double layer capacitance (C_{dl}) decrease indicates that a layer was form indicating the formation of a surface film. This reflects the inhibitor does retard the corrosion rate. This research had found that henna is an excellent natural inhibitor for aluminum alloy in seawater.

Keywords: Aluminium (AA5083), Corrosion Inhibitor, Henna, Seawater

KESAN INAI PADA ETHYL ACETATE UNTUK PERENCATAN ALUMINIUM DALAM AIR LAUT PADA KEPEKATAN RENDAH

ABSTRAK

Aluminium adalah satu subjek penting dalam penyelidikan kerana ia banyak terdapat dalam alam semula jadi mudah untuk mengendalikan. Kini, pengaratan sebatی dalam industri maritime di mana plat kapal mengalami pengaratan dan ia bergantung kepada persekitaran yang berbeza. Kajian ini menyiasat pretasi perencatan inai ke arah AA5083 didalam air laut. Pencirian kakisan diuji dengan menggunakan alat fourier transform infrared spectroscopy (FTIR), kehilangan berat, spektroskopi impedans elektrokimia (EIS), pengutuban potentidinamik (PP) dan alat spectroscopy impedance microscope (SEM). Untuk semua pengukuran kecekapan perencatan (IE%) yang diperolehi dari kaedah yang berbeza, kehilangan berat, rintangan pengutuban (R_p), ketumpatan arus kakisan (I_{corr}) dan kadar kakisan di dalam perjanjian yang baik di mana kecekapan perencatan tertinggi (IE%) adalah 83.84% pada 500ppm selepas 60 hari rendaman. Peningkatan untuk nilai rintangan pemindahan cas (R_{ct}) menunjukkan meningkatnya darjah perlindungan untuk AA5083 dalam larutan penguji dan pengurangan nilai untuk kemuatan dua lapisan (C_{dl}) menunjukkan yang satu lapisan telah terbentuk iaitu pembentukan satu lapisan nipis pada permukaan. Ini membuktikan perencat berfungsi dengan melambatkan kadar kakisan. Kajian ini henna merupakan perencat kakisan yang baik terhadap aluminum aloi dalam air laut.

Kata kunci: Aluminium (AA5083), Perencat Pengaratan, Inai, Air laut
