SCIENCE**

DECLARATION AND VERIFICATION REPORT

FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled:
PRELIMINARY PHYSICAL PROTOTYPE DESIGN OF AUTONOMOUS SURFACE VEHICLE (ASV) By MOHD KHAIREE BIN IBRAHIM Matric No. UK 21242 have been examined and all errors identified have been corrected. This report is submitted to the Department of Maritime Technology as partial fulfillment towards obtaining the **Bachelor Degree of Applied Science (Maritime Technology)**, Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENT

I would like to thank people that help and support me with new knowledge and good information to complete my research thesis. I would like to thank my supervisor, Dr. Ahmad Faisal Bin Mohamad Ayob that helps me a lot during this project. Also thanks to Mr.Nasir as teach for giving me tips and advices during built the fibreglass prototype.

A lot of appreciate to Mr.Afiq that guided me from beginning of my research project. The suggestions given really help me to complete my research. He helps me a lot by explained the steps of the procedures during handling my thesis.

Not to forget also, I would like to thanks my friend especially Mohd Akmal bin Md. Nawawi and Adibah Husna binti Musa that help me a lot accompany me for laboratory measurement. Thanks also my friends that conducting the same project experiment and shared the knowledge together.

Last but not least, my beloved family is really support and understanding that always motivates me to complete my research and finish my thesis. They always be my side and pray for my successful.

Thank you.

PRELIMINARY PHYSICAL PROTOTYPE DESIGN OF AUTONOMOUS SURFACE VEHICLE DATA COLLECTION CRAFT

ABSTRACT

An Autonomous Surface Vehicle (ASV) is a mobile robot designed for aquatic work environments that travel on the water surface and can function without cable or remote control. ASV nowadays is an automatic self-propelled which equipped with rechargeable battery and photovoltaic cell to provide long-lasting power to the system. With solar charge controller, the excess power was stored into the battery which is the system can get the continuously power from the battery. Used renewable energy allows ASV to stay on the surface for long-term by using solar power to recharge the battery. This research about the development of ASV that used double thrusters and wide water plane are used to build the prototype that can handle 6 character of sea. Besides that, the prototype supported by an Arduino UNO board and L298N motor shield to control the movement and power to the others component. Besides that, this ASV also equipped with ultrasonic sensor to avoid the object in fronts them. This prototype can be used in Malaysian Coastal only because due to hot weather and damp throughout the year which can provide sufficient solar ray to the prototype. By using renewable energy which is from solar, new source of alternative power for marine research was developed.

**PROTOTAIP PERMULAAN REKABENTUK FIZIKAL KENDERAAN
PERMUKAAN AIR BERAUTONOMI**

ABSTRAK

Kenderaan Permukaan Air Berautonomi (ASV) adalah sebuah robot kenderaan mudah alih yang direka untuk melakukan kerja-kerja berkaitan akuatik yang beroperasi di atas permukaan air dan boleh berfungsi tanpa kabel atau alat kawalan jauh. ASV kini boleh bergerak sendiri dimana ia dilengkapi dengan sel fotovoltaik untuk membekalkan kuasa yang berterusan kepada sistem dan bateri yang boleh dicas semula. Dengan menggunakan unit pengawal cas solar, kuasa yang dihasilkan daripada sel fotovoltaik akan disimpan ke dalam bateri, dimana sistem akan mendapat bekalan kuasa yang berterusan dari bateri. Tenaga yang digunakan adalah tenaga yang boleh diperbaharui yang membolehkan ASV beroperasi untuk jangka masa yang lama di atas permukaan air dimana bateri dicaj oleh kuasa solar. Penyelidikan ini mengenai perkembangan ASV yang menggunakan dua penujuk dan mempunyai satah air yang luas dimana ASV telah dibina untuk menangani 6 sifat semulajadi laut. Selain itu, ASV yang dibina disokong sepenuhnya oleh litar Arduino UNO untuk mengawal keseluruhan sistem dan disokong oleh litar pemacu motor L298N untuk mengawal arah dan kelajuan motor. Di samping itu, ASV ini juga dilengkapi dengan pengesan ultrasonik untuk mengukur jarak halangan di hadapan dan mengubah laluan dari melanggar halangan tersebut. ASV ini boleh digunakan sepanjang Pantai Malaysia kerana cuaca yang lembap dan terik sepanjang tahun memberikan sinar suria yang mencukupi untuk menjana kuasa kepada ASV.
