PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

Heavy Metal Distribution in Different Size Fraction of Sediment from Kemaman Nearshore Environment oleh Norhani Bt. Abd Razak, No.Matrik UK12313 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Marin sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Marin), Fakulti Pengajian Maritim dan Sains Marin, Universiti Malaysia Terengganu.

Disahkan oleh:

Penyelia Utama

## **ACKNOWLEDGEMENT**

First of all thanks to Allah SWT that provides His never ending bountiful blessing and also guidance and showered on me for the strength and courage of my life. Much tribute for the success of this thesis goes to my supervisor Professor Dr. Noor Azhar bin Mohamed Shazili who offered precious information, kindly guidance, suggestion and comment throughout the completion of this project.

Thanks to Faculty of Maritime Studies and Marine Science especially the laboratory assistants for allowing me to use the facilities at the laboratory and for their helping hands. I also would like to express my deep appreciation and thankful to Mr. Joseph Bidai who helped in my research and for their constructive suggestions in analysis my data.

I'm grateful to my family especially to my beloved mother and father for their supports and love. I love you all. Thanks also to all my friends especially Fizoh, Efa, Nokey, Raja for extending their helps and solving the problems I encountered. Never forgotten my roomates Muz and Intan for their understanding and caring during finishing my thesis.

Last but not least, thank you very much to all who were involved directly during the completion of my project.

## **ABSTRACT**

Sediment collected from 8 stations which located at Kemaman nearshore area were analyzed for Cd, Cu, Zn, Pb and Fe concentration according to sediment fraction size of 40 $\mu\text{m}$ , 63  $\mu\text{m}$ , 90 $\mu\text{m}$ , 125 $\mu\text{m}$ , 250 $\mu\text{m}$  and 500 $\mu\text{m}$  and grain size. Samples were collected using Smith McIntyre and analyzed using ICPMS. The range for concentrations of metals were (0.036 $\mu\text{g/g}$  to 0.143 $\mu\text{g/g}$ ) for Cd, (1.17 $\mu\text{g/g}$  to 12.35 $\mu\text{g/g}$ ) for Cu, (42.55 $\mu\text{g/g}$  to 131.54 $\mu\text{g/g}$ ) for Zn, (13.63 $\mu\text{g/g}$  to 36.78 $\mu\text{g/g}$ ) for Pb and (3.21% to 7.69%) for Fe. The statistical analysis of Pearson Correlation proved that there is significant relationship between metal concentration and size fraction of sediment. The concentration of Cd, Cu, Zn, Pb and Fe increased with the increase of sediment fraction size. From normalization generally metal concentration in the sediment was much influenced by natural process. Sediment ranged from coarse sand to finer sand according to the distance from the shore. Skewness value for all stations is negative. Besides sediment range from poorly sorted to moderately sorted. The data obtained provides a better understanding as well as proper monitoring of pollution level in South China Sea.

## **ABSTRAK**

Sedimen diambil dari 8 stesen yang terletak di kawasan pesisir laut Kemaman untuk dianalisis logam berat seperti kepekatan Cd, Cu, Zn, Pb, Fe berdasarkan saiz fraksi sedimen iaitu  $40\mu\text{m}$ ,  $63\ \mu\text{m}$ ,  $90\mu\text{m}$ ,  $125\mu\text{m}$ ,  $250\mu\text{m}$  and  $500\mu\text{m}$ . Sampel diambil menggunakan pencekau Smith McIntyre dan dianalisis menggunakan ICPMS. Julat untuk kepekatan logam adalah ( $0.036\mu\text{g/g}$  hingga  $0.143\mu\text{g/g}$ ) bagi Cd, ( $1.17\mu\text{g/g}$  hingga  $12.35\mu\text{g/g}$ ) bagi Cu, ( $42.55\mu\text{g/g}$  hingga  $131.54\mu\text{g/g}$ ) bagi Zn, ( $13.63\mu\text{g/g}$  hingga  $36.78\mu\text{g/g}$ ) bagi Pb dan ( $3.21\%$  hingga  $7.69\%$ ) bagi Fe. Analisis statistik kolerasi Pearson membuktikan terdapatnya perkaitan antara kepekatan logam berat dengan saiz fraksi sediment. Daripada penormalan secara umumnya kepekatan logam didalam sediment dipengaruhi oleh proses semulajadi. Julat min saiz bagi sediment adalah antara pasir kasar hingga pasir halus bergantung kepada jarak stesen daripada kawasan pantai. Manakala kepencongan bagi setiap stesen adalah negatif. Disamping itu julat penyisih adalah antara tidak sempurna hingga sederhana sempurna. Data yang diperolehi menerangkan dengan lebih jelas tentang tahap pencemaran serta kaedah pemantauan yang lebih berkesan di kawasan Laut China Selatan.
