## **ACKNOWLEDGEMENTS**

I wish to sincerely thank all of the members of my dissertation committee for their support and guidance. I would like to express my gratitude towards the many people who have helped me during my final year project. First of all I would like to thank Dr Jasnizat Bin Saidin for taking me as a student under his supervision, for his endless encouragement and support along the way. His advice and support in the development of this project and writing was incredibly valuable.

I would like to extend my heartfelt gratitude to my second supervisor, Dr Kesaven A/L Bhubalan for his assistance in finishing my final year project. I wish to express my deep gratitude to the all staff of Institute of Marine Biotechnology and Marine Biotechnology Laboratory of University Malaysia Terengganu for providing the opportunities for allowing using the laboratory and instrument and material for my project.

Finally I would like to thanks to my parents, friends and all contributor for their sacrificed, understanding, support and patience during this final year project.

## **ABSTRACT**

Crude extract of *Stichopus horrens*'s tissues that were collected from Bidong Island, Terengganu were evaluated for their antibacterial, antibiofilm and antioxidant. At the lower concentration of extraction from *S. horrens*'s tissue (0.234 mg/ml), the sample showed negative value in percentage inhibition which is -13.797 %. This indicate that the extraction of tissue from *S. horrens* do not possess antibiofilm activity at lower concentration. When increasing the concentration of sample, the percentage inhibitions also increase up to 49.456 %. However, the continued increasing the concentration of sample, the percentage inhibition are started to decrease to -15.544 %. There is no antibacterial activity detected in the *S. horrens* which is indicating by no inhibition zones were measured against eight types of bacteria tested. Only the controls which are ampicilin (gram-positive) and gentamycin (gram-negative) show the inhibition zone in all the types of bacteria used. For the determination of the antioxidant activity, the crude extract do not showed antioxidant activity compared to the control (Quercetin). The value for percentage of antioxidant for *S. horrens* are from -0.893 % until 1.488 % which are less than antioxidant activity that are possess by Quercetin which is > 82 %.

**KAJIAN MENGENALPASTI POTENSI KEUPAYAAN UNTUK  
ANTIBAKTERIA, ANTIBIOFILM DAN ANTIOKSIDAN DARIPADA TISU  
GAMAT (*Stichopus Horrens*)**

**ABSTRAK**

Ekstrak yang dihasilkan daripada tisu *S. horrens* yang didapati di Pulau Bidong, Terengganu telah dijalankan kajian untuk menentukan aktiviti bagi antibiofilm, antibacterial dan antioksidan. Pada kepekatan pengekstrakan tisu *S. Horrens* yang rendah (0.234 mg/ml), sampel menunjukkan nilai negatif dalam peratusan perencatan iaitu -13.797%. Ini menunjukkan bahawa pengekstrakan tisu daripada *S. horrens* tidak mempunyai aktiviti antibiofilm pada kepekatan yang lebih rendah. Apabila pada kepekatan sampel yang tinggi, peratusan perencatan juga meningkat sehingga 49.456%. Walau bagaimanapun, peningkatan berterusan pada kepekatan sampel, perencatan peratusan akan mula menurun kepada -15.544%. Tidak ada sebarang aktiviti anti-bakteria yang dikesan dalam *S. horrens* yang mana zon perencatan yang diukur tidak mempunyai nilai terhadap lapan jenis bakteria yang diuji. Hanya kawalan iaitu Ampicilin (gram-positif) dan gentamycin (gram-negatif) yang menunjukkan zon perencatan dalam semua jenis bakteria yang digunakan. Bagi penentuan aktiviti antioksidan, sampel tidak menunjukkan sebarang aktiviti pengoksidaan berbanding dengan kawalan (Quercetin). Nilai peratusan perencatan untuk *S. horrens* dari -0.893% sehingga 1.488% yang mana nilai ini rendah jika dibandingkan aktiviti pengoksidaan yang dimiliki oleh Quercetin > 82%.
