DECLARATION AND VERIFICATION REPORT
FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled **Identification of Bacteria Isolated on TCBS from White-Leg Shrimp *Litopenaeus vannamei* Cultured in the West Coast of Peninsular Malaysia** by **Shahzia binti Shah Rasool**, Matric No. **UK26633** have been examined and all errors identified have been corrected. This report is submitted to the School of Marine Science and Environment as partial fulfillment towards obtaining the Degree of Marine Biology, School of Marine Science and Environment, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

I would like to thank my supervisor Prof Madya Dr Yeong Yik Sung for all his support and guidance and all of his help with the collection of data for my thesis. He was always there to gently and kindly guide me along, also to give me reassurance when it looked like I needed it. I would also like to thank my second supervisor, Dr. Kesaven for all his help and guidance within his field of expertise. He always advised me to think out of the box when it came to solving problems concerning my project and thesis.

I would like to thank my best advisor, Madam Wendy Wee for her help and time for me whenever I needed to bounce ideas or need advice. As for my project, I knew of the basics of DNA work but with her willingness to share her expertise I succeed to finished my final year project.

I would also like to thank my fellow friends for all their support during this process.

ABSTRACT

In this present study, eight isolates of bacteria associated with marine shrimp aquaculture were collected from the species *Litopenaeus vannamei*. Mysis and water samples were collected at Gertak Sanggul Aquaculture farm and inoculated on Thiosulphate-Citrate-Bile Salts agar (TCBS) for 72 hours at 37 °C . All of the strains were identified by biochemical test which is Gram staining, followed by 16S ribosomal RNA gene sequence analysis. All the isolated were cultured on Thiosulphate-Citrate Bile Sucrose agar which have been accepted as the selective medium for isolation of *Vibrio* species. . The identification of bacteria amplified with BaF, (5'-AGAGTTGATCCTGGCTCAG-3') and BaR, (5'- GTTACCTTGTACGACTT-3') were conducted using BLAST and EZTaxon. The results revealed the absence of *Vibrio* sp in all the water samples and shrimp tissue examined . Instead, five species of *Bacillus* namely *B. amyloliquefaciens*, *B. megatrium*, *B.methylotrophicus*, and *B. vietnamensis* were found, with *B. amyloliquefaciens* being the major species, representing 62.5% of the total bacteria isolated. These *Bacillus* spp. are probably the probiotic bacteria used in *L. vannamei* culture. *Bacillus*, gives a beneficial effect in controlling microbial infections through competition with harmful microorganisms, produce inhibitory compounds or by stimulation of the immune response of the host. It is noted that Gram –positive bacteria such as *Bacillus* sp are able to grow well on TCBS agar and this possibly indicates that TCBS agar is not a reliable selective media for *Vibrio* isolation.

**IDENTIFIKASI BAKTERIA YANG DIKULTUR KE AGAR TCBS
DARIPADA *Litopenaeus vannamei* YANG DITERNAK DI BARAT
SEMENANJUNG MALAYSIA**

ABSTRAK

Di dalam kajian ini , lapan sampel bakteria yang berkaitan dengan akuakultur udang laut telah dikumpulkan daripada spesis *Litopenaeus Vannamei* . Mysis dan air sampel telah dikumpulkan di ladang Gertak Sanggul Akuakultur dan dikultur pada Tiosulfat - Citrate - Hempedu Garam agar (TCBS) selama 72 jam pada 37 ° C . Semua strain telah dikenal pasti oleh ujian biokimia iaitu Gram staining , diikuti oleh 16S ribosom RNA gen analisis urutan. Semua terpencil telah dikultur pada Tiosulfat - Citrate hempedu Sukrosa agar yang telah diterima sebagai medium terpilih untuk pengasingan spesies *Vibrio* . Pengenalpastian bakteria dikuatkan dengan BAF , (5'- AGAGTTTGATCCTGGCTCAG -3 ') dan BaR , (5'- GTTTACCTTGTACGACTT -3 ') telah dijalankan menggunakan BLAST dan EZTaxon . Keputusan menunjukkan ketiadaan *Vibrio* sp di semua dalam sampel air dan tisu udang yang diperiksa. Sebaliknya, lima spesies *Bacillus* iaitu *B. amyloliquefaciens* , *B. megatrium* , *B. methylotrophicus* , dan *B. vietnamensis* ditemui, dengan *B. amyloliquefaciens* menjadi spesis utama , mewakili 62.5 % daripada jumlah bakteria dikaji. Spesies *Bacillus* ini mungkin adalah daripada bakteria probiotik digunakan dalam akuakultur *L. Vannamei* . *Bacillus* memberikan kesan yang baik dalam mengawal jangkitan mikrob melalui persaingan dengan mikroorganisma yang berbahaya , menghasilkan sebatian yg melarang atau rangsangan gerak balas imun tuan rumah. Didapati juga bahawa bakteria Gram- positif seperti *Bacillus* sp dapat tumbuh dengan baik di TCBS agar dan ini mungkin menunjukkan bahawa TCBS agar bukan media terpilih boleh dipercayai utnuk pengasingan spesies *Vibrio*.
