To the sacred memory of my baby daughter

**NISHITHA**

who left us for ever when I was here  
on my study

## ACKNOWLEDGMENTS

I would like to extend my most sincere gratitude and deep appreciation to Professor Dr. Ang Kok Jee who provided me with invaluable guidance, objective criticism and encouragement throughout the course of the study. I am also indebted to the members of my supervisory committee, Associate Professor Dr. Mohd. Azmi Ambak and Dr. Che Roos Saad, for their constructive suggestions during the study period.

I am grateful to Mr. Cheah Sin Hock, Faculty of Fisheries and Marine Science, for his immense help in the initial phase of the project and in allowing me to use his facilities both at the hatchery and at the office. My appreciation also goes to the Dean and staff of the Faculty of Fisheries and Marine Science for their assistance throughout this study period.

Thanks are due to Associate Professor Dr. Ridzwan Halim, Faculty of Agriculture, and Dr. Sharr Azni Harmin, Faculty of Fisheries and Marine Science, who taught me various statistical packages; to Associate Professor Dr. Mohd. Ali Rajion, Faculty of Veterinary Medicine and Animal Science for advising me on the techniques for analysing fatty acids; and to Drs. B.A.G. Idris, Faculty of Science and Environmental Studies, for verifying the species *Moina micrura*.

I am thankful to Professor Dr. A.F.M. Anawarul Haque, Faculty of Engineering, and Associate Professor Dr. A.K.M. Mohsin, Faculty of Fisheries and Marine Science for encouraging me in many ways during the study period. I also appreciate the assistance of Dr. Rohana P. Subasinghe, Dr. Law Yeah Kok and Mr. N.N. Das in the project and preparation of the thesis.

I am greatly indebted to Dr. M.A. Islam, ex-Director; Dr. M.A. Mazid, Director; and to Dr. M.S. Shah, Chief Scientific Officer of Fisheries Research Institute, Bangladesh who have been instrumental in extending my study leave period.

The financial supports given by the Government of the People's Republic of Bangladesh ( BARC-IDA Credit 1455BD), Council of European Community (CEC-TS 2.0099 M(H)) and the Government of Malaysia (IRPA 1-07-05-012 and IRPA 1-07-05-073) are gratefully acknowledged.

Words are not enough to express my heartfelt feelings to my parents for providing me with their untiring guidance and supports since my childhood. My wife, Momtaz and son, Amit faced many wearisome situations and sacrificed a lot during my long absence from home. Nevertheless, they have extended their moral support and encouragement to me all the while in striving towards this achievement.

Abstract of thesis submitted to the Senate of Universiti  
Pertanian Malaysia in fulfillment of the requirements for the  
degree of Doctor of Philosophy.

**MOINA MICRURA (KURZ) AS A LIVE FOOD SUBSTITUTE  
FOR ARTEMIA SALINA (L.) IN LARVAL REARING  
OF MACROBRACHIUM ROSENBERGII (DE MAN)**

By

MD. JAHANGIR ALAM

Chairman: Professor Ang Kok Jee, Ph.D

Faculty : Fisheries and Marine Science

Four main experiments viz., (i) use of *A. salina* and *Moina micrura*, either solely or in combinations, (ii) ingestion rates of *Artemia* and *M. micrura*, (iii) replacement of *Artemia* with *M. micrura*, either abruptly or gradually, and (iv) effects of cod liver oil (CLO) enriched egg custard, were conducted to evaluate the use of *M. micrura* as an overnight live food substitute for *Artemia* in rearing of *Macrobrachium rosenbergii* larvae.

*M. rosenbergii* larvae fed a mixed diet of *Artemia* and *Moina* and larvae weaned from *Artemia* to *Moina* had either a similar or significantly higher yield of post larvae compared to that fed *Artemia* alone. However, a 50:50 mixture and gradual weaning

with *Artemia* cut off at stage VIII or X resulted in the highest ( $p < 0.05$ ) yield ranging from  $16.81 \pm 1.82$  to  $19.21 \pm 1.54$  PL/l. The production rates of  $9.23 \pm 1.22$  to  $11.26 \pm 1.33$  PL/l for larvae fed *Moina* alone were significantly lower ( $p < 0.05$ ) than that for larvae fed *Artemia* alone ( $13.21 \pm 0.90$  and  $14.27 \pm 1.64$  PL/l). The post larval yield for larvae fed *Moina* cultured on poultry manure (Mpm) was slightly higher than that for larvae fed *Moina* cultured on *Chlorella* and yeast (Mcy). The maximum mortality and significantly lower development in larvae fed *Moina* alone were observed during the first half of rearing period. However, in the later period, larval development and growth of post larvae fed the *Moina* equalled that of larvae fed other diets.

Compared to the individual ingestion rates (IIR) of *Artemia*, a 7 - 4 folds lower IIR of *Moina* were observed for up to stage V larvae. Thereafter, IIR of *Moina* increased and either equalled or surpassed that of *Artemia* in terms of dry mass ingestion and calorie intake. From a 50:50 mixture of *Artemia* and *Moina*, the IIR of *Artemia* was  $\geq 80\%$  up to stage V, but decreased thereafter and that of *Moina* increased steadily.

While n-3 BUFA content was higher in Mpm (8.68%) than that in *Artemia* (6.96%), it was only 0.97% in Mcy. Despite using Mcy as the overnight food, the production rates of  $11.27 \pm 1.35$ ,  $13.02 \pm 1.70$  and  $12.13 \pm 1.35$  PL/l, respectively, for 1, 3 and

5% CLO enriched egg custard were significantly higher ( $p < 0.05$ ) than that of  $7.83 \pm 1.58$  PL/l for egg custard without CLO. However, there was no significant difference in production among the CLO enriched dietary treatments.

In larval rearing of *M. rosenbergii*, *M. micrura* may successfully be used as a supplement with *Artemia* throughout the rearing period or as a substitute for *Artemia* from larval stage VI-VII without any undue reduction in post larval yield.

Abstrak tesis ini dikemukakan kepada Senat Universiti Pertanian Malaysia sebagai memenuhi keperluan untuk Ijazah Doktor Falsafah.

**MOINA MICRURA (KURZ) SEBAGAI MAKANAN HIDUP PENGGANTI  
BAGI ARTEMIA SALINA (L.) DALAM PENTERNAKAN LARVA  
MACROBRACHIUM ROSENBERGII (DE MAN)**

Oleh

**MD. JAHANGIR ALAM**

Pengerusi: Professor Ang Kok Jee, Ph.D

Fakulti : Perikanan dan Sains Samudera

Sebanyak empat eksperimen utama iaitu (i) penggunaan *A. salina* dan *Moina micrura*, sama ada secara tunggal atau gabungan, (ii) kadar penelanan *Artemia* dan *M. micrura*, (iii) penggantian *Artemia* dengan *M. micrura* sama ada secara mendadak atau secara beransur-ansur, (iv) kesan minyak limpa ikan kod (CLO) yang diperkaya dengan kastard telur, telah dijalankan untuk menilai penggunaan *M. micrura* sebagai makanan hidup yang digunakan pada waktu malam bagi menggantikan *Artemia* dalam penternakan larva *Macrobrachium rosenbergii*.

Larva *M. rosenbergii* yang diberikan diet campuran *Artemia* dan *Moina* dan larva yang diberikan *Artemia* serta diikuti dengan *Moina* telah memberikan hasil sama ada sama atau lebih tinggi

dibandingkan dengan pasca larva yang telah diberi makanan *Artemia* sahaja. Bagaimanapun campuran 50:50 dan perubahan diet beransur-ansur dengan *Artemia* diberhentikan pada peringkat VII atau X memberikan hasil yang paling tinggi ( $P < 0.05$ ) berjulat dari  $16.81 \pm 1.82$  hingga  $19.21 \pm 1.5$  PL/l. Kadar pengeluaran larva yang diberi makan *Moina* sahaja ialah  $9.23 \pm 1.22$  hingga  $11.26 \pm 1.33$  PL/l nyata lebih rendah ( $p < 0.05$ ) dibandingkan dengan larva yang diberi makan *Artemia* sahaja ( $13.21 \pm 0.90$  dan  $14.27 \pm 1.64$  PL/l). Penghasilan pasca larva yang diberi makanan *Moina* yang dikultur menggunakan baja ayam ternakan (Mpm) didapati tinggi sedikit daripada larva yang diberi makanan *Moina* yang dikultur dalam *Chlorella* dan ragi (Mcy). Mortaliti maksimum dan perkembangan yang lebih rendah nyata pada larva yang diberi makanan *Moina* sahaja, dan ini telah diperhatikan semasa peringkat pertama awal jangkamasa pemeliharaan. Walau bagaimanapun, dalam jangkamasa penghujung terakhir, perkembangan dan pertumbuhan pasca larva yang diberi makan diet *Moina* didapati sama dengan larva yang diberi makanan diet lain.

Dibandingkan dengan kadar penelanan individu (IIR) *Artemia*, IIR *Moina* diperhatikan 7 - 4 kali ganda lebih rendah sehingga ke peringkat ke V. Selepas itu, IIR *Moina* meningkat sama ada sama atau melebihi *Artemia* dalam konteks penelanan jirim dan pengambilan kalori. Daripada campuran 50:50 *Artemia* dan

*Moina*, *Artemia* IIR adalah > 80% hingga ke peringkat V, tetapi menurun selepas itu dan *Moina* meningkat secara tetap.

Kandungan n-3 HUFA adalah lebih tinggi dalam Mpm (8.68%) daripada dalam *Artemia* (6.96%), sementara dalam Mcy ianya hanya 0.97%. Walaupun dengan menggunakan Mcy sebagai makanan pada waktu malam, kadar pengeluaran bagi 1, 3 dan 5% CLO yang diperkaya dengan kastard telur masing-masing ialah  $11.27 \pm 1.35$ ,  $13.02 \pm 1.70$  dan  $12.13 \pm 1.35$  PL/l, nyata lebih tinggi ( $p < 0.05$ ) dibandingkan dengan CLO tanpa kastard telur iaitu  $7.85 \pm 1.57$  PL/l. Bagaimanapun, tiada perbezaan bererti dalam pengeluaran di antara percubaan menggunakan diet CLO yang diperkaya.

Dalam penternakan larva *M. rosenbergii*, *M. micrura* mungkin boleh digunakan dengan jayanya sebagai pengganti *Artemia* sepanjang tempoh penternakan atau sebagai pengganti bagi *Artemia* dari peringkat larva VI - VII tanpa sebarang penurunan ketara dalam penghasilan pasca larva.
