without his supervision and guidance, this work  
not have been possible.

BY

My appreciation is also extended to Dr. Mohd.  
Haji and Enak Azahar Othman for their  
moral support through this work.  
was conducting this IVY WONG LING LING

My heartfelt thanks to Dr. Mohd. Haji for  
his comments and criticisms on the  
identification of the bacteria.

A report submitted as partial fulfilment  
to the Faculty of Fisheries and Marine Science  
for the degree of B.Sc.(Fisheries).

Malaysia.

I would like to thank my supervisor for his  
continuous especially the help in the use of  
computer and the use of software for the  
data collection and analysis. I am also grateful  
through the research grant given by the Ministry  
of Science and Technology.

## ACKNOWLEDGEMENTS

I would like to express my greatest appreciation and gratitude to Dr. Law Ah Theem, my supervisor whom without his supervision and guidance this project might not have been possible.

My appreciation is also extended to Puan Norzaidah Mawi and Encik Azahar Othman for their technical and moral support through this past eight months or so when I was conducting this research project.

My heartfelt thanks to Dr. Rohana P. Subasinghe for his comments and criticism in my work on the identification of the bacteria.

I would also like to thank my family for their moral support through my years in Universiti Pertanian Malaysia.

Last but not least to all my coursemates, housemates especially Tan Geok Ting (for the use of her Computer) and Yow Geok Yong (transportation -nocturnal data collection) and friends who have supported me through the running of my project, I say a big THANK YOU.

This project was done with the support from the IRPA Research Grant 04-07-05-006.

ABSTRACT

Two bacteria isolated from Port Dickson coastal waters were identified and their petroleum degrading activities were determined. They were identified as *Flavobacterium* sp. and *Micrococcus* sp. Both species were capable to grow on selected alkanes but they were unable to grow on alkenes or aromatic petroleum hydrocarbons. Biodegradation of ESSO Crude oil was measured by weight loss technique. The oil biodegradation rates for *Flavobacterium* sp. and *Micrococcus* sp. were 1.45 mg/l/hr and 1.13 mg/l/hr respectively with 20 day of incubation at 30° C in basal salt medium. The initial cell population of the above studies were  $2.1 \times 10^5$  cells/ml and  $3.3 \times 10^6$  cells/ml respectively.

The effects of nutrients ( $\text{NH}_4^+$  and  $\text{PO}_4^{3-}$ ) on the biodegradation of ESSO Crude oil by the natural population of microorganisms in Port Dickson coastal waters were also conducted by using the weight loss technique. The number of oil degrading microorganisms in the seawater sample used for the study was 320 cells/ml. The highest oil biodegradation rate was found in  $\text{NH}_4^+$  enriched seawater; a value of 76.8 mg/l/day was detected at a concentration of 100 µg-at N/L. Phosphate at 25 and 50 µg-at P/L showed no significant difference in the degrading rate i.e. 69.4 mg/l/day and 70.6

mg/l/day respectively. In combination of both nutrients at a level of 100  $\mu\text{g-at}$  N/L and 50  $\mu\text{g-at}$  P/L, 89.2 mg/l/day biodegradation rate was recorded.

The results indicated that the natural hydrocarbon oxidizing bacteria in the coastal waters off Port Dickson possessed the ability to degrade 6 mg/l/day petroleum hydrocarbons. Under conditions when the seawater was enriched with  $\text{NH}_4^+$  and  $\text{PO}_4^{3-}$  a degradation rate of 89.2 mg/l/day was recorded. The nutrient depletion studies recorded that nitrogen was the limiting factor in the coastal waters off Port Dickson. Attempts to clean up oil spills with the aid of microorganisms should take into consideration of the nutrient deficiencies in the seawater.

Kajian mengenai kesan nutrien ( $\text{NH}_4^+$  dan  $\text{PO}_4$ ) ke atas biodegradasi minyak mentah ESSO (Tapis A) oleh populasi semula jadi perairan Port Dickson juga telah dilaksanakan dengan keadaan kebiasaan berat minyak. Silangan mikroorganisma dari segi kebolehan untuk mendegradasi minyak melah petroleum adalah 6 mg/l/day bagi perairan Port Dickson. Kajian mendapati bahawa kepekatan ammonium paling tinggi iaitu 100  $\mu\text{g-at}$  N/l

## ABSTRAK

kadar dengan hasil adalah paling tinggi antara nutrien.

Dua bakteria dari perairan Port Dickson telah dikenalpasti serta kecekapan mereka untuk mendegradasi petroleum telah ditentukan. Kedua bakteria diidentifikasi sebagai *Flavobacterium* sp. dan *Micrococcus* sp.. Kedua bakteria ini berupaya untuk tumbuh pada beberapa bahan hidrokarbon iaitu dari rangkaian kumpulan alkana dan tiada pertumbuhan diperhatikan pada kumpulan alkena dan kumpulan aromatik. Kajian biodegradasi minyak mentah ESSO (Tapis A) telah dijalankan dengan kaedah kehilangan berat minyak. Kajian mendapati kadar biodegradasi minyak bagi *Flavobacterium* sp. adalah 1.45 mg/l/jam manakala *Micrococcus* sp. pula adalah 1.13 mg/l/jam di dalam tempoh 20 hari di dalam media garam asas. Populasi awalan sel adalah  $2.1 \times 10^5$  sel/ml dan  $3.3 \times 10^6$  sel/ml masing-masing.

menunjukkan susah nitrogen adalah faktor penahan di perairan Port Dickson di dalam aktiviti biodegradasi minyak.

Kajian mengenai kesan nutrien ( $\text{NH}_4^+$  dan  $\text{PO}_4^{3-}$ ) ke atas biodegradasi minyak mentah ESSO (Tapis A) oleh populasi semulajadi perairan Port Dickson juga telah dijalankan dengan kaedah kehilangan berat minyak. Bilangan mikroorganisma dari segi kebolehan untuk mendegradasi minyak mentah petroleum adalah 320 sel/ml bagi perairan Port Dickson. Kajian mendapati pada kepekatan ammonium paling tinggi iaitu 100  $\mu\text{g-at N/L}$ ,

CONTENTS

kadar degradasi adalah paling tinggi antara nutrien ammonia iaitu 76.8 mg/l/hari. Bagi fosfat pula pada kepekatan 25 dan 50  $\mu\text{g-at P/L}$  tidak menunjukkan perbezaan yang bererti dalam kadar deradasi iaitu 69.4 mg/l/hari dan 70.6 mg/l/hari masing-masing.

#### LIST OF DIAGRAMS

1.1.1 Di dalam kombinasi kedua-dua kepekatan nutrien iaitu 50  $\mu\text{g-at P/l}$  fosfat dan 100  $\mu\text{g-at N/L}$  ammonium pula, kadar degradasi yang paling tinggi iaitu 89.2 mg/l/hari diperolehi.
