Nama Penyelia : Prof. Ang Kok Jee
Nama Penyelia Kedua : Dr. Sharr Azni Bin Harmin
Tajuk Projek : Growth And Survival Of
Angelfish (*Pterophyllum spp.*)
Larvae Raised Under Different
Diets

Dengan ini disahkan bahawa saya telah menyemak laporan akhir projek ini dan

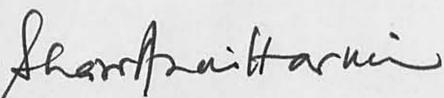

- (i) semua pembetulan yang disarankan oleh pemeriksa - pemeriksa telah dibuat, dan
- (ii) laporan ini telah mengikut format yang diberikan dalam Panduan PSF 499 - Projek dan Seminar, 1994, Fakulti Perikanan dan Sains Samudera, Universiti Pertanian Malaysia.

ACKNOWLEDGEMENT

I wish to express my sincere appreciation to my supervisor, Prof. Ang Kok Jee and also Dr. Sharr Azni bin Harmin, Faculty of Fisheries and Marine Science, Univertiti Pertanian Malaysia, for their useful guidance, patience, encouragement and constructive suggestions during the entire study.

Many thanks to the laboratory assistants for their cooperation and assistance. I would also like to say a big thank you to all my friends and coursemates for their moral support and encouragement in making this project a success.

This study is supported by IRPA Project No. 1 - 07 - 05 - 078 (J01) and 1 - 07 - 05 - 073 (J01).

Finally, I dedicate this project paper to my parents, brother and sisters who have been understanding and supportive throughout the duration of this project.

Abstrak

Kajian ke atas tumbesaran dan kemandirian larva ikan 'angel' (*Pterophyllum* spp.) telah dijalankan dengan menggunakan pelbagai diet. Penetasan buatan telur ikan 'angel' dijalankan untuk mendapat larvanya bagi menjalankan kajian ini. Bagi mencapai objektif yang tertera di atas, 4 eksperimen telah dijalankan. Dalam eksperimen 1, larva yang sudah mencapai peringkat renang bebas telah diberikan 3 jenis makanan, iaitu infusoria (kawalan), rotifer (rawatan 1) dan kuning telur (rawatan 2) untuk menentukan kadar kemandiriannya selepas 6 hari. Dengan berpandukan eksperimen 1, satu lagi diet baru telah ditambahkan dalam eksperimen 2, iaitu *Artemia*. Tujuan eksperimen 3 dilakukan adalah bertujuan untuk menentukan masa yang paling sesuai untuk menggantikan *Artemia* dengan diet lain, *Moina*. Dalam eksperimen 4, kajian telah dijalankan untuk mendapatkan/menentukan masa yang paling sesuai untuk menggantikan *Artemia* dengan makanan tiruan. Setiap rawatan mempunyai tiga replikat.

Pada akhir kajian didapati kadar kemandirian larva ikan angel daripada eksperimen 1 adalah sangat rendah. Julat kadar kemandirian ialah daripada 0 % kepada $10.67 \pm 6.11\%$. Secara langsung, ia menggambarkan bahawa rawatan makanan yang diberikan kepada larva ikan 'angel' itu tidak berapa sesuai. Dalam eksperimen 2, kadar

kemandirian larva ikan 'angel' yang diberi makanan *Artemia* adalah paling tinggi, iaitu $98.33 \pm 2.89\%$ dan ia menunjukkan perbezaan bererti ($P < 0.05$) dengan rawatan lain. Daripada eksperimen 3 yang dijalankan, didapati masa yang paling sesuai untuk menggantikan *Artemia* nauplii dengan *Moina* ialah pada hari ke-6 dalam jangkamasa pengkulturan. Keputusan eksperimen 4 menunjukkan bahawa makanan tiruan tidak sesuai untuk menggantikan *Artemia* sebagai makanan kedua.

Daripada keputusan kajian di atas, dapat disimpulkan bahawa jangkamasa (hari) dan makanan yang paling sesuai untuk pemeliharaan larva ikan 'angel' adalah seperti dibawah :-

Hari pertama hingga hari ke-5 - *Artemia* nauplii

Hari ke-6 hingga hari ke-9 - *Moina*

In experiment 1, the survival rate of the angelfish larvae in oil treatments was very low (ranged from 0% to $10.67 \pm 6.11\%$) suggesting that the treatment diets were not suitable. In experiment 2, larvae fed with *Artemia* nauplii recorded the highest survival rate ($98.33 \pm 2.89\%$) and it is statistically significant ($P < 0.05$) from other treatments. In experiment 3, it was found that the suitable time to replace *Artemia* nauplii with

Abstract

A study on growth and survival of angelfish (*Pterophyllum* spp.) larvae raised under different diets was carried out. The larvae for the above study were raised artificially. In order to achieve the above-mentioned objective, four experiments were done. In experiment 1, free swimming larvae were fed with three types of diet :- infusoria (as control), rotifer (treatment 1) and mash egg yolk (treatment 2) to determine their survival rate after a period of six days. Based on experiment 1, experiment 2 was conducted using an additional diet, *Artemia*. In experiment 3, study was conducted to determine the suitable time for replacing *Artemia* with *Moina*. In experiment 4, the study was conducted to determine suitable time for replacing *Artemia* with artificial diet. All treatments were done in triplicate.

In experiment 1, the survival rate of the angelfish larvae in all treatments was very low (ranged from 0% to $10.67 \pm 6.11\%$) suggesting that the treatment diets were not suitable. In experiment 2, larvae fed with *Artemia* nauplii recorded the highest survival rate ($98.33 \pm 2.89\%$) and it is statistically significant ($P < 0.05$) from other treatments. In experiment 3, it was found that the suitable time to replace *Artemia* nauplii with

Moina was on day 6 of culturing period. The study of artificial diet in experiment 4 showed that this diet is not suitable to replace *Artemia* nauplii as alternative food.

ABSTRACT

From the results of this study, it may be concluded that a suitable diet for larval rearing of angelfish are as below :

LIST OF FIGURES

Day 1 to day 5 - *Artemia* nauplii

Day 6 to day 16 - *Moina*
