PENGHARGAAN

DENGAN NAMA ALLAH YANG MASA PEMURAH LAGI MASA MENGASIHANI

ALHAMDULILLAH... Syukur kehadrat ALLAH kerana dengan izinNya, maka projek ini telah berjaya dilaksanakan sepenuhnya.

Setinggi ucapan penghargaan ini ditujukan kepada penyelia projek ini iaitu Dr. Abol Munafi bin Ambok Bolong. Terima kasih diatas segala tunjuk ajar dan bantuan yang diberikan sepanjang pengajian khususnya kursus SUA 3299 ini. Tidak lupa juga terima kasih kepada penyelaras kursus ini Dr. Siti Aisyah Abdullah.

Ucapan terima kasih juga kepada pembantu-pembantu makmal Sumber Akuatik terutama En. Jo dan Shahrul, Pn Kartini, pembantu hatchery air tawar yang telah banyak membantu didalam menjayakan projek ini.

Teristimewa buat ayahanda **Md. Said Bin Md. Hasan**, bonda **Rahmah Hj. Lassim**, kakak **Nor Zairina** dan **Kak Chik** tersayang terima kasih diatas segala pengorbanan dan sokongan selama ini. Semoga dipanjangkan umur dan dilimpahi rezeki buat selama-lamanya.

Kejayaan ini milik bersama...

Tidak lupa juga kepada mereka yang telah banyak membantu disepanjang kajian ini dijalankan terutama Ladin, En. Zul, Manaf, Yazid, Azhar, Sebastian, Keong, kak Ila, Jalal, Tham, Ali, Niza, Siha dan Ena. Terima kasih yang tidak terhingga dan jasa kalian dikenang selamanya.

Buat Yus, Ayu dan Mas, semoga persahabatan ini kekal hingga ke akhir hayat. Terima kasih diatas segala tunjuk ajar, bantuan dan persahabatan.

Buat Salehin bin Aman, *thanks for the love and care.*

Akhir sekali tidak lupa juga kepada semua yang terlibat didalam projek ini samada secara langsung atau tidak. Terima kasih semua.

Oscar,
n dan

ABSTRACT

A study was done to observe the egg and larva development of Oscar, *Astronotus ocellatus* up to juvenile stage. The aim of the study was to observe the egg and larva development as well as to determine the suitable first feed for larva which could give the highest growth and survival. The eggs were obtained through natural spawning. Morphological observation was done by using a light microscope and further development was drawn by the aid of LUCIDA camera. Three different diets that is *Artemia nauplii*, *Daphnia* and formulated diet (35 % protein) were given to the larva.

The result of the study found that the broodstock spawned at a water temperature between 26.1 – 27.1 °C. The fertilized eggs were not transparent, submerged, ellipsoidal and yellow opaque in colour and without any presence of oil globule. Mean height and length of the egg was 1.61 ± 0.27 mm and 1.88 ± 0.07 mm respectively. Hatching occurred 32 hr. 14 min. after fertilization at water temperature 27.0 – 28.3 °C. Newly-hatched-larvae measured 4.88 ± 0.01 mm in total length with a large ellipsoidal yolk. Larvae reached postlarva stage 36 hour after hatching and consume exogenous food 3 days after hatching. The egg yolk was totally absorbed 4 days after hatching. Larva reached juvenile stage through metamorphosis 12 days after hatching.

The result of the feeding experiment showed that larva fed with *Artemia* recorded the highest survival rate and growth 50 % and 8.69 % respectively while larva fed with *Daphnia* have 42% and 7.47 %/ day respectively. Larva which were fed with artificial diet died on the 10th day of experiment. Based on the finding above it can be said that *Artemia nauplii* are suitable feed for *Astronotus ocellatus* larva first feeding stage which give larva a high survival rate and growth (One-way ANOVA $p<0.05$).
