ACKNOWLEDGEMENT

I would like to thank God for his blessing in giving me the strength and patience to completely this Master degree project. This project was made possible with the corporation and help of so many people. They have contributed towards my understanding and thoughts.

I would like to thank my supervisor, Dr Muhammad Arshad Javed for his guidance, advices and providing me with information during the study. Many thanks to the Laboratory Manager, Dr Alina Wagiran for allowed me to use the laboratory facilities throughout the project. Special thanks go to Mrs. Atiqah and Ms. Farah, endless help and fully assistance rendered. I also would like to acknowledge to PhD students in my laboratory, Ms. Nusrat and Mr. Sami Khan for their help during this project. Then, not forget to my Universiti Malaysia Terengganu (UMT) for giving me an opportunity and scholarship to continue study here.

Last but not least, I wish to thank to all my family and friends for their help, support and encouragement given. Thank you.

ABSTRACT

Marker assisted selection (MAS) in rice depends on the good purity and quantity of extracted genomic DNA. The cost of DNA extraction protocol, time frame and plant sample (generally the leaf) are the main limitations in the extraction of DNA. Several factors were set up to evaluate the effects of these on efficiency of DNA extraction by using Ikeda protocol. Ikeda DNA extraction protocol is one of the most convenient DNA extraction protocols from leaves. Purity and quantity of genomic DNA was measured by using Nanodrop. Among all these factors, seedling age significantly influences the purity of genomic DNA extraction from leaves. ANOVA reflected that an interaction of these factors significantly affect the purity and quantity of genomic DNA. It is suggested that the leaves (10 mg) of two weeks of seedling could give the desired purity of DNA to screen the segregation population at molecular level.

ABSTRAK

‘Markers Assisted Selection’ pada padi amat bergantung kepada keaslian DNA dan kuantiti DNA yang bagus pada DNA genomik yang diekstrak. Kos yang tinggi, jangka masa yang lama dan jumlah berat sampel daun merupakan limitasi dalam ekstrak DNA. Beberapa faktor ditetapkan untuk mengkaji kesan kesan ke atas keberkesanan ekstrak DNA dengan menggunakan kaedah ekstrak DNA oleh Ikeda. Protokol ekstrasi DNA daripada Ikeda adalah salah satu kaedah protokol ekstrasi DNA yang diyakini ramai untuk mengekstrak DNA daripada daun. Keaslian dan kuantiti DNA diukur dengan menggunakan Nanodrop. Kesemua faktor yang dijalankan menunjukkan hanya tempoh anak benih ditanam memberikan perbezaan jelas terhadap keaslian genomik DNA yang diekstrak. ANOVA berkesan menunjukkan terdapat hubung kait untuk kesemua faktor terhadap keaslian dan kuantiti genomik DNA. Oleh itu, dicadangkan bahawa dengan menggunakan daun (10 mg) dari 2 minggu anak benih ditanam boleh memberikan keaslian DNA yang diperlukan dalam membuat penyaringan populasi segregasi padi pada tahap molekular.
