AKNOWLEDGEMENTS

I would like to express my gratitude to my supervisor Cik Faridah for her guidance and advice. Her patience and support is always highly appreciated.

And, special thanks to all the kindergarten's authorities, teachers, the children and their parents for cooperation. All of them have given excellent responses in this study. Their cooperation, patience and understanding are always highly appreciated.

Also special thanks to all my friends for leading me a hand during sampling. Last but not least, my warmest family for their full support and encouragement.

ABSTRAK

Laporan ini merupakan keputusan daripada kajian mengenai fungsi pepuru kanak-kanak tadika yang tinggal berdekatan dengan kawasan perindustrian petrokimia. Masalah respirasi sering dikaitkan dengan masalah pencemaran udara walaupun kurang kajian dijalankan di Malaysia. Perindustrian petrokimia telah dilapor merupakan sumber pencemaran udara yang utama, bahan pencemaran dari loji petrokimia merupakan bahan karsinogen ini. Objektif kajian ini adalah untuk menguji fungsi pepuru kanak-kanak tadika yang tinggal berdekatan kawasan perindustrian petrokimia (kawasan kajian) dan membandingkannya dengan kanak-kanak yang tinggal jauh dari kawasan perindustrian petrokimia (kawasan rujukan). 66 kanak-kanak dari tiga tadika di kawasan perindustrian petrokimia dan 65 kanak-kanak dari tiga tadika di kawasan rujukan telah dipilih sebagai subjek kajian. Satu set soal selidik telah diedarkan dan diisi oleh ibubapa kanak-kanak masing-masing dan fungsi pepuru mereka diuji dengan menggunakan vitalograph spirometer dalam keadaan berdiri. Seperti yang dijangka, fungsi pepuru kanak-kanak yang tinggal berdekatan kawasan perindustrian petrokimia adalah lebih rendah daripada kanak-kanak di kawasan rujukan. Mereka menunjukkan perbezaan yang signifikan dalam ukuran VC, FVC dan FEV₁. Di samping itu, simptom-simptom respirasi terutamanya batuk adalah lebih prevalen di kawasan perindustrian petrokimia berbanding dengan kawasan rujukan. Oleh itu, gas yang dibebaskan dari kilang perindustrian petrokimia di Paka mungkin meninggalkan kesan yang tidak baik terhadap sistem respirasi kanak-kanak seperti yang ditunjukkan iaitu, fungsi pepuru yang rendah dan prevalen yang tinggi terhadap simptom-simptom respirasi.

ABSTRACT

Reported herewith are the results from a study of lung function of kindergarten children living near a petrochemical industrial area. Air pollution has been associated with respiratory symptoms although there is a lack of such studies in Malaysia. Petrochemical industrial area is reported as the major air pollution sources with the pollutants from the plant considered as environmental carcinogens. The objective of this study was to determine the lung function of kindergarten children living near the petrochemical industrial area (study area) compared to children living farther away from the plant (reference area). 66 kindergarten children from three kindergartens in petrochemical industrial area and 65 kindergarten children from three kindergartens in reference area have been chosen as the study subjects. A set of questionnaires were distributed and filled by the parents and the lung function (VC, FVC and FEV₁) was tested by a vitalograph spirometer in standing position. As expected, the lung functions of kindergarten children living near the petrochemical were significantly lower than children in reference area. They showed significant differences in measurement of VC, FVC and FEV₁. In addition, respiratory symptoms especially cough, were more prevalent in petrochemical area compared to reference area. Therefore, the emission from the petrochemical industry in Paka may have some adverse impact on these children's respiratory system as indicated by low lung function and high prevalence of respiratory symptoms.
