ACKNOWLEDGEMENT

First and foremost, I would like to thank Allah The Almighty for with His blessings, I acquired the spiritual strength to complete this thesis. I would also convey my sincere appreciation and gratitude to my supervisor, Cik Hazlina binti Ahamad Zakeri from the Department of Biological Sciences, Faculty of Science and Technology for her advice, comments and guidance throughout my final year project. Her views and advices play important role in the success completion of the thesis.

Secondly, I would like to dedicate my thanks to both the Biochemical Lab officers namely Cik Nor Azlina and Cik Ku Naiza for their assistance in coping with the technical problems of using reverse-phase high performance liquid chromatography (HPLC). Their kind cooperation and patient are highly appreciated.

Thank you to my fellow labmates, Alia, Siti, Ika, Ain, Syida and Adun for helping me in many ways and encouraging me throughout my project.

Finally, I would like to express my whole hearted love and gratitude to my family especially my parents, for their moral, financial and mental support to make this thesis a success. Thank you very much.

ABSTRACT

The effect of different organic solvents as reaction media for transesterification of palm olein was studied. The organic solvents studied used were: dimethylsulphoxide (log P -1.3), tetrahydrofuran (log P 0.49), diethylether (log P 0.85), heptane (log P 4.0) and isooctane (log P 4.52). Transesterification reaction was carried out at 60°C and 200 rpm for 6 hours using an immobilized lipase from *Aspergillus niger* as catalyst. The catalytic performance of the lipase was appraised by determining the changes in peak composition and concentrations by Reversed-Phase High Performance Liquid Chromatography (RP-HPLC) and the calculated degree of hydrolysis (DoH) as well as degree of transesterification (DoT). Transesterification resulted in an increase in Peak 3 for all the solvents studied except for diethylether. Peak 8 was observed to increase in at least three of the solvents (i.e. tetrahydrofuran, heptane and isooctane) whilst Peak 1 was observed to increase in at least two of the solvents (i.e. tetrahydrofuran and diethylether) studied. Peak 2 and Peak 6 was increased when palm olein was transesterified in dimethylsulphoxide and heptane, respectively. A new peak, Peak 4 was only observed in diethylether. DoH was the highest when isooctane was used as medium with 0.4%. This was followed by palm olein transesterified in heptane (0.11%), diethylether (0.09%), tetrahydrofuran (0.03%) and dimethylsulphoxide (0.03%). Isooctane also gave the highest DoT with 5.47%, followed by tetrahydrofuran (2.97%), diethyleter (2.25%), dimethylsulphoxide (0.84%) and heptane (0.05%). The results obtained show that the lipase was active in all range of organic solvents with isooctane being the best medium to be used in this study.

TRANSESTERIFIKASI KE ATAS MINYAK OLEIN KELAPA SAWIT DALAM PELARUT ORGANIK MENGGUNAKAN *Aspergillus niger* LIPASE TERSEKAT-GERAK.

ABSTRAK

Kesan ke atas pelbagai pelarut organik sebagai media tindak balas untuk transesterifikasi ke atas minyak olein kelapa sawit telah dijalankan. Pelarut organik yang digunakan adalah dimetilsulfida ($\log P$ -1.3), tetrahidrofurana ($\log P$ 0.49), dietileter ($\log P$ 0.85), heptana ($\log P$ 4.0) dan isooktana ($\log P$ 4.52). Tindak balas diteruskan pada 60°C dan 200 rpm selama 6 jam menggunakan lipase dari *Aspergillus niger* sebagai katalisis. Persembahan katalitik dari lipase ditentukan dengan melihat perubahan pada komposisi dan kepekatan puncak yang didapati dari RP-HPLC dan juga pengiraan darjah hidrolisis serta transesterifikasi. Hasil transesterifikasi menunjukkan peningkatan pada puncak ke 3 untuk semua pelarut kecuali dietileter. Puncak ke 8 didapati menunjukkan peningkatan pada sekurang-kurangnya tiga pelarut (tetrahidrofurana, heptana dan isooktana) manakala Puncak 1 didapati meningkat pada sekurang-kurangnya dua pelarut (tetrahidrofurana dan dietileter). Puncak 2 dan 6 menunjukkan peningkatan apabila transesterifikasi dalam dimetilsulfida dan heptana. Puncak yang baru, iaitu Puncak 4 diperhatikan dalam dietileter. Darjah hidrolisis yang tertinggi didapati apabila isooktana digunakan sebagai media dengan nilai (0.4%). Ini diikuti oleh minyak olein kelapa sawit yang ditransesterifikasi dalam heptana (0.11%), dietileter (0.09%), tetrahidrofurana (0.03%) dan dimetilsulfida (0.03%). Isooktana juga memberi nilai darjah transesterifikasi tertinggi dengan nilai 5.47%, diikuti oleh tetrahidrofurana (2.97%), dietileter (2.25%), dimetilsulfida (0.84%) dan heptana (0.05%). Keputusan ini menunjukkan bahawa lipase aktif dalam semua julat pelarut organik dan isooktana adalah media terbaik untuk kajian ini.
