PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: Cryostorage of *Cryptocoryne ciliata*. oleh Chee Pui Yee , no. matrik: UK 6388 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Biologi), Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

Disahkan oleh:

Penyelia Utama DR. AZIZ BIN AHMAD (Ph.D)
LECTURER

ACKNOWLEDGEMENT

I am grateful to God for giving me strength to complete all my work on time. I wish to express my sincere thanks to my supervisor, Dr. Aziz Bin Ahmad, for his supervision and helping me to complete my project. I also wish to thank Dr. Cha Thye San and Cik Wan Bayani for their help in my project.

Thanks to my parents and my family for their support and encouragement. I would like to thank Abas, Kak Rokiah, Kak G, Kak Ira, Kak Yati, Nyamuk and all the members in INOS for helping me at Makmal Biotech Marin 2. Besides that, I would also like to thank Mr Mazrul and Cik Norazlina for allowing them using Makmal Biotech lab after office hour and I would like to this opportunity to thank my course mate, Sue San who has helped me in preparing the proposal and thesis. Lastly, I wish to express my cordial thanks to my housemate and friend, Lai Siew for her patience, support, and encouragement.

ABSTRACT

Twenty primers were screened. Four primers, OPA4, OPA7, OPA10 and OPA16 showed the clearest bands and polymorphism was chosen for *Cryptocoryne ciliata*. Vitrification technique was used to obtain the cold storage procedure for *C. ciliata*. No surviving explant was obtained after being immersed in liquid nitrogen. Preculture, loading, dehydration, unloading and warming upon cold storage of explants were examined. After two to four days of preculture, 30 minutes of loading period, one hour of dehydration in PVS (Plant Vitrification Solution), 20 minutes of unloading treatment and warming in 40 °C for one minutes. Explants stored in the freezer at 0 °C and -20 °C showed 20 to 60% survival rate. Thus, more improvement can be done to increase the survival rate of the explants, for example the modification in concentration of PVS and the elongation of the preculture duration.

PENYIMPANAN SEJUK *Cryptocoryne ciliata*

ABSTRAK

Dua puluh primer telah digunakan untuk menentukan primer yang sesuai bagi *Cryptocoryne ciliata*. Empat primer yang memberikan jalur pemisahan DNA genome yang terbaik dan boleh mengesan polymorphism gen *C. ciliata* telah ditentukan, iaitu OPA4, OPA7, OPA10 dan OPA 16. Teknik vitrifikasi digunakan untuk menentukan kaedah penyimpanan sejuk bagi *C. ciliata*. Dalam kajian ini, tiada pokok yang hidup selepas disimpan dalam cecair nitrogen. Pra-kultur, pemuatan (loading), pengeringan (dehydration), penurunan (unloading) dan pemanasan ke atas pokok dalam penyimpanan sejuk telah diuji. Selepas dua hingga empat hari pra-kultur, 30 minit pemuatan, sejam pengeringan dalam PVS (Plant Vitrification Solution), 20 minit penurunan dan pemanasan dalam suhu 40 °C selama seminit. Bagi pokok yang disimpan dalam peti sejuk pada suhu 0 °C dan -20 °C, 20% hingga 60% pokok berjaya hidup selepas pra-kultur selama empat hari. Dengan itu, pengubahsuaian diperlukan untuk meningkatkan kebolehan pokok hidup. Contohnya, perubahan dalam kepekatan PVS (Plant Vitrification Solution) dan pemanjangan tempoh pra-kultur.
