PENGAKUAN DAN PENGESAHAN LAPORAN PROJEK PENYELIDIKAN I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

Preliminary Study on Artificial Foods for the Spotted Seahorses, *Hippocampus kuda* oleh Liew See Leng, No. Matrik UK 7643 telah diperiksa dan semua pembedaan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Samudera sebagai memenuhi sebahagian daripada keperluan memperoleh Ijazah Sarjana Muda Sains (Biologi Marin), Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

Disahkan oleh:

LIEW HOCK CHARK

ACKNOWLEDGEMENTS

This work would not have been done without the help and support from many others. In particular, I would like to thank my supervisor Prof. Madya Liew Hock Chark, for his enthusiasm for my personal success. He had provided motivation and recommendation that have been invaluable to this project. I would like to thank Prof. Madya Dr. Anuar Hassan for his guideline and important idea.

I would never have made it this far without my family especially to my beloved parent, Liew Ah Chuan and Lee Yoke Poh. I would like to thanks my cutely housemate, Pak Hui Hoon, Lee Feei Ling and my lover, Quah Chong Jin who have been more concerned about my progress and unconditionally supported any endeavor that would lead to my happiness, be it a Bachelor degree of Marine Biology.

| A Raw data of incremental growth rates | 58 |
| B Raw data of weekly growth rate (ANOVA Single factor) | 70 |
| C Raw data of relationship (REGRESSION statistics) between standard length, weight, and volume in the three treatments | 75 |
| D Raw data of calculation for proximate analysis | 80 |
| E Raw data of Proximate analysis (Protein, fat, and carbohydrate) | 81 |
| F Data analysis of protein, fat, and carbohydrate in the four types of foods | 82 |

ABSTRACT

Seahorses have not generally been reared on artificial food in commercial culture due to difficulties in getting them to accept non-live foods (Woods, 2002). In this study, feeding trials were undertaken to measure growth and survival adult seahorses, *Hippocampus kuda*; fed with two types of artificial feed compared to natural feed. The artificial feeds tested were a shrimp-flour mix (Type A) and a fish-flour mix (Type B) while the natural feed was frozen shrimps. Growth rates however did not vary among the three treatments. The incremental growth and high survival rate of *H. kuda* among the artificial feed and natural feed were promising for the development of seahorse aquaculture. The shrimp-flour mix and fish-flour mix can be gradually phased in to replace both frozen shrimp and natural foods items. Market survey of the prices conducted in Terengganu and Kuala Lumpur found shrimp to be more expensive than fish. Protein constituted the most expensive component of seahorses' diets. Proximate analysis revealed that artificial food type B had higher protein 66% than the others. Weekly growth in addition of the relationship between growths rate between the three treatments were obtained in the 24 week period. Survival rates of up to 90 % were achieved by the end of the experimental period. This constituted an important preliminary study towards formulating artificial feeds for seahorses for large scale commercial culture.

ABSTRAK

Ikan Lumba Kuda Laut biasanya tidak kultur dalam makanan tiruan di komersial kultur dengan sebab kesusahan bagi mereka untuk menyesuaikan diri dengan makanan yang bukan hidup (Woods, 2002). Dalam kajian ini, ujian makanan telah dijalankan untuk mengukur kadar pertumbuhan dan kadar kemandirian bagi dewasa ikan, *Hippocampus kuda*; memakan dengan dua jenis makanan tiruan berbanding dengan makanan asal. Ujian makanan tiruan adalah adunan udang-tepung (Jenis A) dan adunan ikan-tepung (Jenis B) manakala makanan asal adalah udang beku. Kadar pertumbuhan walaubagaimanapun tidak menunjukkan perbezaan antara tiga jenis perlakuan. Pertambahan dalam pertumbuhan dan ketinggian dalam kadar kemandirian bagi ikan lumba kuda laut di antara makanan buatan dan makanan asal telah mempunyai harapan yang baik dalam akuakultur. Adunan udang-tepung dan adunan ikan-tepung boleh beransur-ansur digantikan dengan udang beku dan makanan asal. Kajian harga pasaran yang dijalankan di Terengganu dan Kuala Lumpur mendapati udang lebih mahal daripada ikan. Protein menjadi sejenis komponen yang mahal dalam makanan ikan lumba kuda laut. Analisis Proximat telah menunjukkan makanan buatan jenis B mempunyai protein yang tertinggi iaitu 66% jika berbanding dengan makanan yang lain. Pertumbuhan dalam mingguan, di samping hubungan antara kadar pertumbuhan di antara tiga kelakuan telah didapati dalam jangka masa 24 minggu. Kadar kemandirian sebanyak 90% telah mencapai sepanjang masa eksperimen tamat. Ini merupakan satu kajian pendahuluan yang penting untuk formula makanan buatan bagi ikan lumba kuda laut dalam komersial kultur.
