## **ACKNOWLEDGEMENT**

Alhamdullillah, a great thank to ALLAH S.W.T that had gave an opportunity for me to accomplish this research. A lot of thanks go to Mr. Kasawani Ibrahim for graciously agreeing to be my supervisor and also giving a supportive morale and technical during this research. Some notable thank to Assoc. Prof. Sulong Ibrahim as my co-supervisor. I am sincerely grateful for the time throw in along this research by Mr. Mohd Suffian Hj. Idris as an informatics lab manager and also as a software expertise who had monitored this project.

Deeply indebted to my beloved parent Mr. Bahrim Othman and Mrs. Baya Dais and my brothers and sister, Rhaymiezam, Rhaymayzan, Rhaymay Azlan, Rhaymay Akbar and Kak Sulmah. They always become my aspiration all the way in this project.

Much gratitude also goes to the many individuals who contributed to this research especially Karthigayen, Mohd Yunus Ibrahim and Ruzalizam for the lecturer, Institute of Oceanography (INOS), Faculty of Science and Technology (FST) that helped me smooth through this project and others who directly or indirectly involved.

Many thank are goes to my outstanding buddies, my special friend and also my housemates Mohammad Zaini Zainal, Kim, Eja, Eija, Yo, Rini, Muni, and Mala also to Biodiversity friends for never ending supported and remain as my inspiration.

## **ABSTRACT**

This research contributes to monitoring the determination of boundaries and preliminary changes using differential global positioning system (DGPS) from Penarik to Gong Batu, Setiu Wetlands. Identification of the current boundary of study area can be determined from the differential global positioning system (DGPS) vector format. Changes in shapes of the shoreline and island with time can be obtained. Furthermore, allowed determination of the average and annual changes of the shoreline and the island moved area in hectare (ha). Process of accretion and erosion is a cycle processes that occurring through out the year. This process contributes a formation of new shoreline and island within the Setiu Wetland. Sand movement from 1980 to 2004 in Setiu Wetland around 2.73 meters per year and island exist within this area experienced high changes in accretion than erosion which the total accretion about 2.57 hectares per year and total erosion around 0.93 hectares per year. The total scope of study area increase around 10.31 hectares from 1980 to 2004.

**Pengenalpastian sempadan dan perubahan dengan menggunakan Differential Global Positioning System (DGPS) dari Penarik ke Kampung Gong Batu di Setiu Wetland.**

**ABSTRAK**

Kajian ini menyumbang ke arah mengawasi pengenalpastian sempadan dan perubahan dengan menggunakan Differential Global Positioning System (DGPS) dari Penarik ke Kampung Gong Batu di Setiu Wetland. Pengenalpastian sempadan baru bagi kawasan kajian dapat diperolehi daripada DGPS dalam format vektor. Perubahan bentuk pulau dan pantai mengikut masa dapat ditentukan. Disamping itu, ia dapat juga menentukan purata dan perubahan tahunan bagi kawasan pantai dan pergerakan kawasan pulau dalam hektar. Proses penambahan dan hakisan merupakan proses berkitar sepanjang tahun. Proses ini menyumbang kepada pembentukan pantai dan pulau yang baru di Setiu Wetland. Pergerakan pasir dari tahun 1980 hingga 2004 di Setiu Wetland adalah sebanyak 2.73 meter per tahun dan pulau yang wujud dalam kawasan ini mengalami perubahan yang lebih dalam pertambahan daripada hakisan dengan jumlah pertambahan sebanyak 2.57 hektar per tahun dan jumlah hakisan adalah sebanyak 0.93 hektar per tahun. Jumlah keseluruhan bagi kawasan kajian bertambah sebanyak 10.31 hektar dari tahun 1980 hingga 2004.
