**PENGAKUAN DAN PENGESAHAN LAPORAN  
PROJEK PENYELIDIKAN I DAN II**

Alasan ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

**Growth Response Of Painted Terrapin (*Callagur borneoensis*) Hatchlings To Commercially Available Feeds** oleh **Nor Marianti bt Nor Azham**, No. Matrik UK 8273 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Samudera sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Biologi Marin), Fakulti Sains dan Teknologi, Kolej Universiti Sains dan Teknologi Malaysia.

## **ACKNOWLEDGEMENT**

I am grateful to Allah s.w.t whose countless blessings enable me to complete my research. Firstly, a thousand thanks to my supervisor, Prof Dr Chan Eng Heng for her continuous comments, concern, and patience throughout the course of this project, and to my co-supervisor, Mr Choo Chee Kuang for his brilliant ideas and guidance.

I wish to thank my loving family for their support and understanding during the duration of this project. This acknowledgement is not complete without an appreciation for cooperation and great support from my painted terrapin team Ude, Laili, Shikin, and post graduate students, Miss Chen Pelf Nyok and Mr Soh Chong Leng. Doing this project with all of you have given me a lot of memories to cherish.

Last but not least, I would like to thank all my coursemate and Mr Azlan Hizami for giving me continuous motivation and inspiration.

## **ABSTRACT**

This project investigates the growth response of 45 *Callagur borneoensis* hatchlings fed using five different combinations of feeds such are frog pellet, frog pellet mixed with morning glory (*Ipomoea aquatica*), tilapia pellet, tilapia pellet mixed with morning glory, and morning glory. The amounts of pellets given were 1.5% of the body weight. Growth response was determined as increment in body weight, straight carapace length, straight carapace width, and shell depth. Growth increment in weight, straight carapace length, straight carapace width, and shell depth for the whole experiment were 89.89g; 2.69cm, 2.24cm; 1.16cm, for terrapins fed tilapia pellet, 86.66g; 2.54cm; 2.24cm; 1.07cm, for terrapins fed frog pellet, 75.11g; 2.47cm; 2.05cm; 1.05cm for terrapins fed frog pellet mixed with morning glory, 71.78g; 2.37cm; 2.03cm; 0.98cm, for terrapins fed tilapia pellet mixed with morning glory and 8.89g; 0.71cm; 0.74cm; 0.38cm, for terrapins fed morning glory. All the treatments showed the significant differences between each other for every parameters tested, especially in weight gain (ANOVA,  $F = 9.8636$ ,  $p = 0.0000257$ ). Two-way ANOVA analysis was used to indicate the significant differences between treatments. From the results, hatchlings fed tilapia pellet exhibiting the highest growth.

## **ABSTRAK**

Projek ini adalah bertujuan untuk mengkaji tindak balas pertumbuhan 45 ekor anak tetasan tuntung laut (*Callagur borneoensis*) terhadap lima jenis kombinasi makanan yang berbeza iaitu pelet katak, pelet katak bercampur kangkung (*Ipomoea aquatica*), pelet tilapia, pelet tilapia bercampur kangkung, dan kangkung. Peratusan makanan yang diberi adalah 1.5% daripada berat badan anak tetasan. Tindak balas perumbuhan ditentukan melalui empat parameter iaitu berat badan, panjang lurus karapas, lebar lurus karapas, dan kedalaman cengkerang. Kadar pertumbuhan bagi berat, panjang lurus karapas, lebar lurus karapas dan kedalaman cengkerang bagi keseluruhan eksperimen adalah 89.89g; 2.69cm, 2.24cm; 1.16cm, bagi pemakanan pellet tilapia, 86.66g; 2.54cm; 2.24cm; 1.07cm, bagi pemakanan pellet katak, 75.11g; 2.47cm; 2.05cm; 1.05cm bagi pemakanan pelet katak bercampur kangkung, 71.78g; 2.37cm; 2.03cm; 0.98cm, bagi pemakanan pelet tilapia bercampur kangkung dan 8.89g; 0.71cm; 0.74cm; 0.38cm, bagi pemakanan kangkung. Kesemua anak tetasan bagi setiap jenis pemakanan menunjukkan perbezaan yang nyata terutamanya dalam peningkatan berat (ANOVA,  $F = 9.8636$ ,  $p = 0.0000257$ ). ANOVA dua hala digunakan untuk mencari perbezaan antara jenis makanan yang diuji. Keputusan menunjukkan pemakanan pelet tilapia memberikan pertumbuhan tertinggi sepanjang eksperimen.
