(Supervisor)

ACKNOWLEDGEMENTS

First of all, I would like to express my gratitude and appreciation to my supervisor, Puan Zamzahaila Binti Mohd Zin for her constructive suggestions, invaluable advice, guidance and comments that had helped me tremendously in the preparation of this thesis. I wish also very grateful for her patience, care and encouragement that she had so generously offered throughout the duration of this project and in reviewing the manuscript.

My deep appreciation is accorded to Cik Nasrenim, Puan Fadlina, Cik Rose Haniza, Cik Suzana,Cik Aniza and Encik Aswardy for their technical assistance during this research work. Sincere thanks are extended to their generous sacrifice of time in providing invaluable comments that had helped me greatly in the preparations of this thesis. I thank to Puan Mariam for supplying the torch ginger plants for me for my research.

Last but not least, I would like to express my deepest gratitude to my beloved family and peers for their endless encouragement, patience, and sacrifices, which had helped me in my undertakings, and to complete this research study.

ABSTRACT

In this study, the nutritional composition and antioxidative activity of various part of torch ginger's plant were observed. The samples were : bud, flower, leaf and rhizome of torch ginger (*Etlingera elatior*). The aim of this study was to determine proximate analysis of sample involved, determine the antioxidative activity by using ferric thiocyanate method (FTC) and determine total phenolic compounds by Folin-Ciocalteu method . From proximate analysis, there were no significance difference ($p<0.05$) of moisture content in all samples. Rhizome presented the highest mineral content in ash determination. Protein and lipid percentages in all samples were assumed as too low and there were no significance difference ($p<0.05$) between bud and flower, and also no significance difference ($p<0.05$) between leaf and rhizome of torch ginger. All samples were higher in carbohydrates. Methanol (polar) and ethyl acetate (non-polar) were used in antioxidant analyses as extracting solvent. Butylated hydroxytoluene (BHT), synthetic antioxidant and α -tocopherol, natural antioxidant were used as a standard. Among the samples tested, ethyl acetate extracts of torch ginger's rhizome presented the highest antioxidative in both methanol and ethyl acetate extracts and it is more efficient in inhibiting lipid oxidation than α -tocopherol. There were no significance difference ($p<0.05$) of methanol extracts of torch ginger's bud and flower. The antioxidative activity of leaf extracts was lower compared to BHT and close to α -tocopherol. In total phenolic compound determination, all samples of ethyl acetate has no significance ($p<0.05$) difference. While in methanol extracts, there were no significance ($p<0.05$) difference between bud and leaf extracts. In this study, rhizome in methanol extracts presented the highest phenolic compounds.

KOMPOSISI NUTRIEN DAN AKTIVITI ANTIOKSIDA DALAM KUDUP, BUNGA, DAUN, DAN AKAR KANTAN (*Etlingera elatior*)

ABSTRAK

Dalam kajian ini, komposisi nutrien dan kandungan antioksidan bagi pelbagai bahagian pokok kantan telah dikenalpasti. Sampel yang terlibat adalah bahagian kudup, bunga, daun dan rizom pokok kantan (*Etlingera elatior*) digunakan. Tujuan utama kajian ini dijalankan adalah untuk mengenalpasti nilai proksimat setiap sampel, mengenalpasti aktiviti antioksidan dengan menggunakan kaedah ferric thiocyanate (FTC), dan mengenalpasti kandungan fenolik sampel menggunakan kaedah Folin-Ciocalteu. Dari kajian yang dijalankan, tidak terdapat perbezaan signifikan ($p<0.05$) untuk kandungan lembapan. Rizom mengandungi kandungan mineral yang paling tinggi dibandingkan sampel lain. Manakala, peratus lipid dan protein dalam setiap sampel adalah sangat rendah dan tidak terdapat perbezaan signifikan ($p<0.05$) diantara kudup dan bunga kantan, juga tidak terdapat perbezaan signifikan ($p<0.05$) antara daun dan rizom kantan. Kandungan karbohidrat dalam setiap sampel adalah tinggi. Dalam penentuan aktiviti antioksidan, methanol (polar) dan etil asetat (tidak polar) digunakan sebagai larutan pengekstrak. Antioksidan sintetik iaitu Butylated hydroxytoulene (BHT) dan antioksidan semulajadi iaitu α -tocopherol digunakan dalam penentuan antioksidan menggunakan FTC dan Folin-Ciocalteu. Rizom kantan didapati mengandungi aktiviti antioksidan tertinggi dalam kedua-dua ekstrak methanol dan etil asetat. Rizom juga didapati lebih efisien dalam merencatkan pengoksidaan lipid dibandingkan dengan α -tocopherol. Tidak terdapat perbezaan signifikan ($p<0.05$) antara ekstrak kudup dan bunga kantan. Manakala aktiviti antioksidan dalam daun kantan adalah lebih rendah dibandingkan dengan BHT dan α -tocopherol. Dalam penentuan kandungan fenolik pula, semua ekstrak sampel bagi etil asetat tidak mempunyai perbezaan signifikan ($p<0.05$). Manakala, dalam ekstrak metanol juga tidak terdapat perbezaan signifikan ($p<0.05$) antara ekstrak daun dan kudup. Dalam TPC, didapati rizom mengandungi kandungan fenolik paling tinggi.
