ACKNOWLEDGEMENTS

First of all I wish to express my sincere appreciation and gratitude to my supervisor, Dr. Hii Yii Siang, for his comments, criticism, constant support with invaluable advice and time through out this year. Without his countless help and encouragement, I would not be able to complete this project successfully.

Special thanks to Mr. Liew Hock Chark, Dr. Hing Lee Siang , Mr. Raymond, Mr. Sharol and all Anatomy and Physiology Laboratory assistances for their for their endless support, helpfulness during the sampling trip and laboratory analysis.

My deepest gratitude also reach to Madam Nur Asma bt. Ariffin, Mr. Shahreza b. Md. Sheriff, Ms. Xavera Anak Dady, Ms. Ain bt. Liah, Ms. Nurul Huda bt Mohd Ishak and Mr. Ady Dhamiri B. Mohd Haniff , Asma, Leen, Sheila and all those who had contributed in one way or another to this project.

Finally, I am especially grateful gratitude to my parents and lovely person for their love, care and support they gave to me all these years.

ABSTRACT

The fringing reefs around the Pulau Redang are the major tourism attraction which also important in restoring fish stock in the marine ecosystem. They are extremely sensitive to pollution. High concentration of nitrogen and untreated sewage can cause serious degradation of coral reefs. Nitrogen is the primary concerns of sewage and domestic discharges. A total of six sampling station were established along the coastal water off Pasir Panjang. Three sampling trip were conducted from July to October 2005. The highest concentration of ammonium, nitrate, nitrite and dissolved organic nitrogen were $32.72 \pm 5.88 \mu\text{M}$, $3.65 \pm 1.83 \mu\text{M}$, $1.03 \pm 1.78 \mu\text{M}$ and $0.82 \pm 0.42 \mu\text{M}$ respectively. Extra ordinary distribution of *Caulerpa* sp. was found in the study area. The *Caulerpa* sp. was extensively distributed during July and it is subsided during September and October. Most probable number of fecal coliform bacteria in September and October 280 MPN/100ml and 240 MPN/100ml respectively. High MPN indicated this show the coastal area slightly contaminated by sewage. Based on present study, the water quality level of nitrogen still in safety level. However, high MPN of fecal coliform indicates that, effluent from the anthropogenic impact is prevalent in the area.

ABSTRAK

Karangan di sekitar Pulau Redang merupakan tarikan utama pelancong juga penting bagi membaikpulih stok ikan di dalam ekosistem marin. Karangan sangat sensitif terhadap pencemaran. Kepekatan tinggi nitrogen dan sisa kumbahan yang tidak dirawat akan menyebabkan kerosakan serius kepada karangan. Nitrogen merupakan kaitan rapat dengan sisa kumbahan dan pembuangan domestik. Enam stesen persampelan ditetapkan di pesisir pantai Pasir Panjang. Sebanyak tiga persampelan telah dijalankan dari bulan Julai hingga Oktober 2005. Kepakatan tertinggi bagi ammonium, nitrat, nitrit dan nitrogen organik terlarut dengan kepekatan masing-masing $32.72 \pm 5.88 \mu\text{M}$, $3.65 \pm 1.83 \mu\text{M}$, $1.03 \pm 1.78 \mu\text{M}$ dan $0.82 \pm 0.42 \mu\text{M}$. Terdapat taburan luar biasa *Caulerpa sp.* di kawasan kajian. Taburan *Caulerpa sp.* ini tinggi pada bulan Julai dan semakin berkurangan pada bulan September dan Oktober. Nilai MPN untuk bakteria fecal coliform pada bulan September dan Oktober masing-masing adalah 280 MPN/100 ml dan 240 MPN/100 ml. Ketinggian nilai MPN menunjukkan pesisiran dicemari oleh sisa kumbahan. Berdasarkan kajian ini, kandungan nitorgen di pesisiran pantai dalam masih ditahap selamat. Walaubagaimanapun, ketinggian nilai MPN bagi bakteria fecal coliform adalah disebabkan oleh kesan aktiviti antropogenik di kawasan kajian.
