**BORANG PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk:

Performance Evaluation of Asymmetric Nanofiltration Membrane: Effect of Dye Concentration on Dye Removal Treatment oleh FARHANAH BINTI SULAIMAN, No. Matrik UK8033 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Kejuruteraan sebagai memenuhi sebahagian daripada keperluan memperoleh Ijazah SARJANA MUDA TEKNOLOGI (ALAM SEKITAR), Fakulti Sains dan Teknologi, Universiti Malaysia Terengganu.

ACKNOWLEDGMENT

Glory to Allah! Thanks for providing wisdom and encouragement all the way in accomplishing this final year project!

Here, I would like to express the deepest gratitude to my main supervisor in University Malaysia Terengganu, Dr Nora'aini Ali for all the invaluable guidance, support and constructive criticism throughout this practical. An extremely grateful to my co-supervisor, Mr. Asmadi Ali for her support, tolerance, commitment and helpful suggestion are deeply appreciated for a lifetime. A lot of thank to all of our lectures for supporting giving the guidelines and references to performed this study.

Next, a greatly appreciate my respected person, Mr. Rahman for his advice, valuables idea and suggestion for project development. I also would like to express the warmest appreciation to all the lab assistance in Water and Environmental Lab especially to Ms Mazalina, Ms Najmu, Mdm Siti Zulaikha, Mr. Razali, Mr. Razman and Mr. Mahmud for providing the entire necessary facilities lab work and not forgotten also to all masters student especially Ms Nor Hidayah and Mdm Nurud Suria for their cooperation and help during make observation. Lastly, sincere appreciation goes to parent whose moral and financial supports. Also to my friend in the same lab, it is a great pleasure indeed to have to the opportunity work. Hope all of us have a successful career and enjoyable life forever.

ABSTRACT

Membranes has been received a great deal of attention as an alternative that can be used for the purification of dye complex wastewater streams. Asymmetric NF membrane meets the necessary standards caused by the capability to retain ions as well as relatively small organic molecules from an aqueous solution. Asymmetric NF membrane was developed to evaluate the efficiency of asymmetric NF membrane for dye removal application. Asymmetric NF membranes were developed by the dry/wet phase inversion method from casting solutions containing 23% Polysulfone (PSf) as polymer and N-methyl-2 pyrrolidone (NMP) as solvent using a semi automated electrically controlled casting machine. Membrane had been fabricated at the three different of shear rate (353.9 s^{-1} , 232.6 s^{-1} and 161.8 s^{-1}). Pure water flux was measured before the membranes were characterized in term of salt rejection and theoretical approach. The morphology of the membranes were observed by using Scanning Electron Microscopy (SEM) for identifying of the membrane structure Membrane performance have been measured by employing five aqueous solution of Reactive Black 5 with concentration of 100 mg/l to 500 mg/l. Operating pressure in the range 2 bars to 10 bars were applied. According to the experimental result of pure water flux and applied Steric Hindrance Pore model, the highest shear rate gives the best performance of membrane. In the investigation on effect of dyes concentration, flux was decreased when increasing RB5 concentration. Flux decline was happen during the time caused by fouling. RB 5 rejection proportionally increased with the RB5 concentration. Donnan effect became a dominant in this separation process. Application of dye removal exceeding 90% of dyes will promise advanced treatment option for pollution control in dye complex wastewater streams.

ABSTRAK

Membran merupakan alternatif yang terbaik yang boleh digunakan untuk menyingkirkan pewarna kompleks dalam airtsisa. Proses membran yang mencapai keperluan piawai adalah membran penuras nano asimetrik disebabkan keupayaan menahan ion dan molekul organik yang kecil daripada larutan akues. Tujuan kajian ini dilaksanakan adalah untuk pencirian membran penuras nano asimetrik terbaik dan mengkaji kesan kepekatan pewarna terhadap membran tersebut. Membran penuras nano asimetrik di sediakan melalui kaedah balikan fasa kering / basah menggunakan larutan polysulfone (PSf) berkepekatan 23% sebagai polimer dan N-methyl-2 pyrrolidone (NMP) sebagai pelarut menggunakan mesin pengacuan elektrik separa automatik. Membran di sediakan mengikut tiga perbezaan kadar ricih (353.9 s^{-1} , 232.6 s^{-1} and 161.8 s^{-1}). Membran di nilai berdasarkan ketelapan air dan penciriannya berdasarkan peratus penyingkiran garam dan penggunaan teori model. Morfologi membran dikaji menggunakan pengimbas mikron elektroskopik untuk mengenalpastian struktur membran terbaik. Prestasi membran di nilai dengan menggunakan lima larutan Reactive Black 5 dengan kepekatan 100 mg/l sehingga 500 mg/l. Tekanan yang digunakan adalah berjulat di antara 2 bar hingga 10 bar. Berdasarkan keputusan eksperimen ujian ketelapan air dan penggunaan model, didapati kadar ricih tertinggi menghasilkan membran berprestasi tinggi. Fluk semakin berkurang dengan pertambahan kepekatan RB5. Penurunan fluk berlaku mengikut masa disebabkan sekatan molekul pada liang membran. Penyingkiran RB5 adalah berkadar langsung dengan kepekatan. Kesan Donnan adalah dominan dalam proses ini. Aplikasi penyingkiran pewarna yang melebihi 90% akan menjanjikan pilihan rawatan terbaik untuk kawalan pencemaran di dalam airtsisa berpewarna.
