PROJEK PENYELIDIKAN I DAN II
RESEARCH REPORT VERIFICATION**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: WOUND ASSOCIATED FUNGUS ISOLATED FROM TEMBUSU (*Fragraea fragrans*) oleh HARYATI BINTI ABDUL RAHIM, no. matrik: UK 10471 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Biologi), Fakulti Sains dan Teknologi, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENT

First and foremost, I would like to express my deepest appreciation and sincere gratitude to my supervisor, Miss Jamilah Bt Salim@Halim for all her endurance in assisting me throughout the completion of this project.

My work on this project was also shaped by the inputs from all the Microbiology Laboratory Assistants who shared their knowledge and guidance throughout the project. Unsolicited comments from them also very helpful. A portion of this project was made possible by supports and cooperation from my friends especially Asuar Ayuni Anuar, Zatul Himmah Samsudin and Nurshela Mohd Nai.

Lastly, I wish to express my heartfelt gratitude to my loving parents for being a constant source of encouragement, and also to other individuals that involved either directly or indirectly. So, I also extend a debt of gratitude to all of them.

ABSTRACT

Fungal colonization in living tree usually associated with wounds. Rapid growth of mycelium in the open wound may cause the process of decay occurred. The isolation and characterization of fungus associated with artificial stem wound of *Fragraea fragrans* were conducted in heath vegetation of Rantau Abang, Terengganu from October 2006 to February 2007. A total of 17 individuals fungus from six genera were recorded and isolated. Six species of fungi were isolated from wound that exposed stem inner bark and five species of fungi were isolated from wound of exposed sapwood. The most frequently isolated genus was *Trichophyton* with seven individuals fungus, (42% of total isolated fungus). Although there were several common fungi isolated from both wound depth, there was indication that succession pattern of fungus was different. Possible factors that determined fungus population on wound over time are discussed.

**PEMENCILAN KULAT DARIPADA LUKA BUATAN PADA POKOK
TEMBUSU (*Fragraea fragrans*)**

ABSTRAK

Pengkolonian kulat pada pokok hidup lazimnya dikaitkan dengan luka. Pertumbuhan miselium yang cepat di atas luka yang terdedah boleh menyebabkan proses pereputan kayu berlaku. Pemencilan dan pencirian kulat yang berasosiasi dengan luka buatan pada batang pokok *Fragraea fragrans* telah dijalankan di kawasan vegetasi padang di Rantau Abang, Terengganu dari Oktober 2006 sehingga Februari 2007. Secara keseluruhannya, sejumlah 17 individu kulat yang terdiri daripada enam genus kulat telah direkod dan dipencilkan. Enam spesis kulat telah berjaya dipencilkan daripada luka yang mendedahkan bahagian dalaman kulit pokok dan lima spesis kulat telah dipencilkan daripada luka yang mendedahkan bahagian berkayu pokok. Genus kulat yang paling kerap dipencilkan ialah *Trichophyton* dengan tujuh individu kulat, (42% daripada jumlah kulat yang dipencilkan). Walaupun terdapat beberapa spesis kulat yang serupa dipencilkan daripada kedua-dua kedalaman luka, kemungkinan terdapat corak sesaran kulat yang berbeza mengikut kedalaman. Faktor-faktor yang mungkin mempengaruhi populasi kulat berdasarkan masa turut dibincangkan.
