PENGAKUAN DAN PENGESAHAN LAPORAN
PROJEK PENYELIDIKAN I DAN II
RESEARCH REPORT VERIFICATION

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: DIVERSITY, ABUNDANCE AND DISTRIBUTION ON PALMAE OF BUKIT BAUK FOREST RESERVE AND SEKAYU RECREATIONAL FOREST oleh AMAL NAJIHAH BINTI MUHAMAD NOR, no. matrik: UK 10477 telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains Gunaan Pemuliharaan dan Pengurusan Biodiversiti, Fakulti Sains dan Teknologi, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

Alhamdulillah, thanks to God finally I had finished my final project report. Firstly, I wish to extend my deepest appreciation and gratitude to my supervisor Mr. Kasawani Ibrahim for his guidance, constructive, comments, continuous support and invaluable advice throughout the duration of the study.

I am deeply indebted to University Malaysia Terengganu for the facilities and equipments and the laboratory staffs, especially Tuan Hj. Razali Salam, for their kindness and helping hand. Special thank to all my friend especially Nur Hairunnisa Rafaai, Nurhidayah Ishak, Salwa Kamisan and Suhaitah Laisin for their kindness, assistance, supports and sacrifices.

Last but not least my sincerity, appreciation to my beloved mother Mrs. Aminah Hamzah, family members, my colleagues, and my dearest friend, for their continuous support encouragement, sacrifices and invaluable help in making my study here possible.

I would like to thank all those who have contributed in every aspect and whom I had inadvertently omitted mentioning.

ABSTRACT

This study was conducted at Bukit Bauk Forest Reserve and Sekayu Recreational Forest to determine the diversity, abundance and distribution of Palmae and to relate the species existence in both locations with environmental factor. The data were recorded in plot 20 x 50 m² at the lower (148 m) and upper (345 m) elevations in Bukit Bauk Forest Reserve and at the lower (101 m) and upper (290 m) elevations in Sekayu Recreational Forest. The physical parameters such as light intensity, air humidity and soil humidity at those areas were also measured. A total of 448 individuals out of 15 species of Palmae were recorded in both locations. There were 10 species with 250 individuals were recorded in Bukit Bauk Forest Reserve while in Sekayu Recreational Forest, a total of species recorded was eight with 198 individuals. *Licuala glabra* and *Livistona endauensis* were found abundance in Bukit Bauk Forest Reserve while in Sekayu Recreational Forest, *Pinanga disticha* and *Arenga* spp. was the most abundance species. Compared to Sekayu Recreational Forest, Bukit Bauk Forest Reserve has the high diversity and species richness of Palmae because of this area has less disturbances. The factors of environmental conditions influence Palmae diversity and distribution where species found in lower elevation were higher than upper elevation. Lower elevation in Bukit Bauk Forest Reserve and Sekayu Recreational Forest has a good growth potential for Palmae species where Palmae growth affected by moist climates, high air and soil humidity.

**KEPELBAGAIAN, KELIMPAHAN DAN TABURAN SPECIES PALMA DI
HUTAN SIMPAN BUKIT BAUK, DUNGUN DAN HUTAN REKREASI
SEKAYU, TERENGGANU**

ABSTRAK

Kajian ini telah dijalankan di Hutan Simpan Bukit Bauk dan Hutan Rekreasi Sekayu untuk memastikan kepelbagaian, kelimpahan dan taburan Palmae dan untuk mengaitkan kewujudan spesis di kedua-dua kawasan dengan faktor alam sekitar. Data telah direkod dalam plot $20 \times 50 \text{ m}^2$ di ketinggian bawah (148 m) dan atas (345 m) di Hutan Simpan Bukit Bauk dan di ketinggian bawah (101 m) dan atas (290 m) di Hutan Rekreasi Sekayu. Fizikal parameter seperti keamatan cahaya, kelembapan udara dan tanah telah diambil di kawasan berkenaan. Sejumlah 448 individu daripada 15 spesis Palmae telah direkod di kedua-dua kawasan. 10 spesis dengan 250 individu telah direkodkan di Hutan Simpan Bukit Bauk manakala di Hutan Rekreasi Sekayu, jumlah spesis yang dijumpai adalah lapan spesis dengan 198 individu. *Licuala glabra* dan *Livistona endauensis* telah mendominasikan Hutan Simpan Bukit Bauk manakala di Hutan Rekreasi Sekayu, *Pinanga disticha* dan *Arenga* spp. adalah spesis yang paling dominan. Dibandingkan dengan Hutan Rekreasi Sekayu, Hutan Simpan Bukit Bauk mempunyai ketinggian kepelbagaian dan kekayaan spesis Palmae kerana kawasan ini kurang gangguan. Faktor keadaan alam sekitar mempengaruhi kepelbagaian dan taburan Palmae dimana spesis yang dijumpai di ketinggian bawah lebih tinggi daripada ketinggian atas. Ketinggian bawah di Hutan Simpan Bukit Bauk dan Hutan Rekreasi Sekayu mempunyai potensi pertumbuhan yang baik untuk spesis Palmae dimana pertumbuhan Palmae disebabkan oleh iklim yang lembap, kelembapan udara dan tanah yang tinggi.
