PENGAKUAN DAN PENGESAHANAN PITA I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: **EFFECTS SERUM IGA IN WHITE RATS VACCINATED WITH KILLED *Pasteurella multocida* B2 ORALLY** oleh **K VISHNUTHARAN A/L KALIMUTHU**, No. Matrik: **UK12155** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains (Sains Biologi), Fakulti Sains dan Teknologi, Univrsiti Malaysia Terengganu.

Disahkan oleh:

DECLARATION

I hereby declare that this thesis entitled Effects serum IgA in White Rats vaccinated with killed *Pasteurella multocida* B2 orally is the result of my own research except as cited in the references.

Signature	:	
Name	:	K Vishnutharan A/L Kalimuthu
Matrix No	:	UK12155
Date	:	11 May 2008

ACKNOWLEDGEMENTS

First of all, I would like to express my heartfelt gratitude to my supervisor, Associate Professor Dr. Mohd Effendy Abd. Wahid, for being supportive and guidance towards the success of my final year project. Furthermore, I also would like to convey my utmost gratefulness to the staffs of Institute of Biotechnology Marine, Universiti Malaysia Terengganu, especially Kak Eamy, Kak Tirah, Abang Suwik, Abang Izat, Mr Wong, Kak Tikah, Abang Din, Patricia, Abang Andri and others for their willingness to encourage, and always there to give us a hand whenever needed.

Lastly, I also appreciate my friends especially Sangeetha, Venothini, Thiru, Luven, Sathya, Vijay, Mangales, Yoga, Nivaharan, Thiban, Rafi, Christ and Wawa for their assistance during my project even though they were busy with their own project. I hope that my thesis will be a good guidance and reference for upcoming final year project students to do their research regarding on this topic.

Finally, thank you very much to all those who always being with during this project and those who I never mention their name before.

ABSTRACT

Pasteurella multocida B2 is the main cause of Haemorragic septicaemia (HS), a cronic disease that infects cattles and buffoles in the region of Asia. Therefore,a study was done to induce the production of Immunoglobulin a (IgA) as to increase the protection against this disease. Thus, this study was carried out to determine the concentration and level of IgA in serum followed by exposure to formalin killed *Pasteurella multocida* B2. In the study, 36 clinically healthy female Albino Winstar rats were divided into four groups according to the dosage that will be exposed; Group 1 (10% vaccination dosage), Group 2 (30% vaccination dosage), Group 3 (50% vaccination dosage) and Group 4 (negative control). There were two oral vaccination exposures done in week 1 and week 3 in the form of food prepared. Enzyme-linked immunoabsorbent assay (ELISA) was subjected to the serum samples collected once every week from each rats from all the groups respectively to determine the level of IgA. As a result, significant difference ($p<0.05$) of IgA were obtained among all the groups in the study. The serum IgA levels of white rats exposed to formalin killed *Pasteurella multocida* B2 in group 3 showed a higher level of IgA as a reaction to immune response following exposure throughout the study and peaked in week 6 compared to the IgA level of white rats in Group 1 and Group 2 monitored throughout the study. It was concluded that the concentration of IgA in the serum of white rats increased following exposure to killed *Pasteurella multocida* B2 orally.

ABSTRAK

Pasteurella multocida B2 adalah penyebab utama Hemorragic Septicaemia, merupakan penyakit kronik yang khususnya menjangkiti haiwan ternakan seperti kambing, lembu dan kerbau di benua Asia. Oleh yang demikian, satu kajian telah dibuat untuk mendorong penghasilan Immunoglobulin A (IgA), merupakan antibodi yang memberi perlindungan terhadap penyakit ini. Kajian ini telah dibuat untuk menentukan tahap dan kepekatan IgA dalam serum darah berikutan vaksinasi terhadap *Pasteurella multocida* B2 yang telah dimatikan. Sebanyak 36 tikus putih spesies Albino Winstar telah dibahagikan sama kepada empat kumpulan mengikut sukanan dos vaksin yang ditetapkan. Kumpulan 1 (10% dos vaksin), kumpulan 2 (30% dos vaksin), kumpulan 3 (50% dos vaksin) dan kumpulan 4 (kawalan negatif). Sebanyak dua vaksinasi oral telah dibuat iaitu pada Minggu 1 dan Minggu 3 dalam tempoh jangkamasa 14 hari. Vaksinasi oral dilakukan dalam bentuk pemakanan kepada tikus putih. Sampel serum telah diambil serta dikumpul setiap minggu dari setiap kumpulan dan Enzyme-linked immunoabsorbent assay (ELISA) telah dijalankan ke atas semua sampel serum bagi menentukan tahap IgA. Keputusannya, terdapat perbezaan secara signifikasi ($p<0.05$) jika dibandingkan dengan keempat-empat kumpulan. Tahap IgA dalam serum berikutan vaksinasi *Pasteurella multocida* B2 pada kumpulan 3 mencatatkan nilai tertinggi terhadap vaksinasi kedua pada Minggu 3 jika dibandingkan dengan Kumpulan 1 dan Kumpulan 2. Sebagai kesimpulan, tahap IgA dalam serum darah meningkat selepas didedahkan vaksinasi oral, *Pasteurella multocida* B2 yang telah dimatikan.
