**PENGAKUAN DAN PENGESAHAN LAPORAN  
PROJEK PENYELIDIKAN I DAN II  
RESEARCH REPORT VERIFICATION**

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: **ISOLATION AND IDENTIFICATION OF FREE LIVING AMOEBAE IN WATER AT HUTAN LIPUR JAMBU BONGKOK, TERENGGANU** oleh **NUR IZZATI BT ROSEMI**, no. matrik: **UK12212** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Sains Biologi sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah **SARJANA MUDA SAINS (SAINS BIOLOGI)**, Fakulti Sains dan Teknologi, Universiti Malaysia Terengganu.

## **ACKNOWLEDGMENT**

First and foremost, I would to express my special thanks to my family for being very supportive and always be my side. Their motivation had encouraged me a lot ever since I began my life as a UMT student. Secondly, my gratitude and appreciation would goes to my supervisor, Assoc. Prof. Dr Nakisah Mat Amin for her guidance and advice from the beginning of my project until the end. I had learnt so much of new things, gained knowledge and skills that helped me a lot as a biological sciences student. My special thanks also being dedicated to Kak Paei, Kak Dah and Kak Aifa for their help during completing my project at INOS laboratory. To Kak Paei, thanks a lot for being very patient in helping and guiding me lots of things from the beginning until I successfully completed this project. My thanks also goes to Dr Aznawati, as Final Year Project Coordinator, Miss Azlina, the Science Officer for the permission to use the laboratories under Biological Department, as well as Kak ti, Lab Assistant in Microbiology Laboratory and Encik Muhammad, Lab Assistant in Histology Laboratory for helping me during my work at the laboratories. Not to forget, to all my friends under supervision, Wanie, Jaa, Ila, Shima, Achik, Syafaf and Apih. Thanks a lot for the support and cooperation during accomplishing this project. Without you all, I would not being able to complete my project successfully. Last but not least, thanks to all Biological Sciences Students and to everyone that had contributed during my final year project. Thank you.

## **ABSTRAK**

Tujuan kajian ini dijalankan adalah untuk mengasing dan mengecam spesies ameba, mengkaji taburan dan bilangan species ameba dan menentukan perkaitan di antara kualiti air dan spesies ameba di dalam air Hutan Lipur Jambu Bongkok, Terengganu. Sampel air diambil (5cm hingga 10cm dari permukaan air) menggunakan sembilan botol polietilin yang steril pada sembilan lokasi pensampelan. Proses pengasingan ini dilakukan dengan menggunakan kaedah turasan bermembran (menggunakan 0.45 µm kertas nitrat selulos). Proses pengkulturan dilakukan dan diulang sehingga kultur yang tulen diperolehi. Proses pengecaman dilakukan berdasarkan morfologi sista dan tropozoit mengikut kekunci Page (1988). Penilaian kualiti air dijalankan di lokasi pensampelan dan di makmal. Sekurang-kurangnya tiga spesies ameba dijumpai dalam kajian ini iaitu *Platyamoeba placida*, *Acanthamoeba castellanii*, dan *Acanthamoeba polyphaga*. *Platyamoeba placida* merupakan spesies yang paling kerap dijumpai pada lokasi L1, L2, L3, L4, L6, L7 dan L8 berbanding spesies ameba yang lain. pH dan suhu air yang diperolehi berjulat dari 4.42 -6.24 dan 26-30 °C masing-masing sementara nilai TDS berjulat dari 0.019-0.025 g/l. Kesemua lokasi pensampelan menunjukkan nilai saliniti yang rendah berjulat dari 0.01-0.02ppt. Secara keseluruhannya, nilai TSS adalah meningkat dari lokasi L1 sehingga L9 dan berlawanan dengan nilai DO. Terdapat perkaitan antara kualiti air dan taburan spesies ameba dalam air. *Platyamoeba placida* dapat hidup dalam air pada nilai DO yang berjulat dari 1.27-7.97mg/L dan pada nilai TSS 41-96mg/L. *A. castellanii* hadir pada nilai DO 2.80 mg/L dan pada nilai TSS 70mg/L. *A. polyphaga* dapat hidup pada nilai DO 1.13 mg/L dan pada nilai TSS 106 mg/L . Secara keseluruhannya, semua ameba mempunyai nilai TDS yang berjulat dari 0.019-0.025 g/L.

## ABSTRACT

The aims of this study were to isolate and identify the amoeba species, to determine their distribution and number of species and to associate between physico-chemical parameter of water and amoeba species in water at Hutan Lipur Jambu Bongkok, Terengganu. Water samples were collected (5cm to 10cm depth from water surface) by using nine sterile polyethylene bottles at nine sampling sites. The isolation process was carried out by using a membrane filtration unit (0.45 µm cellulose nitrate paper). The cultivation and sub-cultivation were done until pure cultures were obtained. The identification of amoebae was done based on morphology of cyst and trophozoites according to the Key of Page (1988). Water quality assessment was done *in situ* and in the laboratory. At least, three different amoeba species were found in this study and were identified as *Platyamoeba placida*, *Acanthamoeba castellanii*, and *Acanthamoeba polyphaga*. *Platyamoeba placida* was the most frequently encountered species of amoebae since it was found at L1, L2, L3, L4, L6, L7 and L8 compared to the other species of amoebae. The water pH and water temperature were ranging from 4.42-6.24 and 26-30 °C respectively, while TDS values were ranging from 0.019-0.025 g/l. All the sampling sites showed low water salinity ranging from 0.01-0.02ppt. Overall, the values of TSS were increasing from L1 to L9 and inversely related with DO values. There was a relationship between water quality and distribution of amoeba species in the water body. *Platyamoeba placida* can live in water with DO values ranging from 1.27-7.97mg/L and TSS 41-96mg/L. *A. castellanii* were available in water with DO values at 2.80 mg/L and TSS values at 70mg/L. *A. polyphaga* was survive with DO values at 1.13 mg/L and TSS values at 106 mg/L. Overall, the TDS values were ranging from 0.019-0.025 g/L for all amoebae.
