DECLARATION

I hereby declare that this thesis entitled Isolation of *Mannheimia haemolytica* from local and imported goats in commercial farm in Terengganu is the result of my own research except as cited in the references.

Signature : 
Name : Norsyuhada Binti Ismail
Matrix No : UK12004

ACKNOWLEDGEMENT

I would like to take this opportunity to express my gratitude to Assoc. Prof. Dr. Mohd Effendy Abdul Wahid for his comments and advices until this study was successfully completed. In addition, a special thanks to Dr. Noraznawati Ismail as my coordinator.

For my beloved parents and special friend, Abdul Hafiz Baharudin, the patience and support that had been given was really enough to inspire me to achieve in this study. I really appreciate it.

I also greatly indebted to the all staff of Ladang Rakyat Terengganu, Cheneh for the painstaking care that were provided and also for their helping hand.

A special thanks also goes to Nor Suzira Deraman for their helping hand and also for IMB's research assistants especially Suvik and Eamy Nursaliza for all the supporting.

In a nutshell, thanks to all which were involved directly or indirectly in this study.

ABSTRACT

Mannheimia haemolytica is one of the most important respiratory pathogens of domestic ruminants and causes serious outbreaks of acute pneumonia. The importance of this study is to know the prevalence of *Mannheimia haemolytica* and the factors associated with this prevalence in Ladang Rakyat Terengganu, Cheneh. In this study of isolation, nasal swab were collected from 120 clinically healthy local and imported goats and were divided into three groups that were pre-weaning, weaning and adult group. Collection of samples was done in six times, three times before monsoon season and another three times during monsoon season. The swabs were inoculated onto blood agar with 5% sheep blood and Mac Conkey agar. Further confirmation of bacterial isolation was done by using API 20E. As a result, no *Mannheimia haemolytica* was isolated before monsoon season but 0.97% of the organisms were isolated during monsoon season. Therefore, it was concluded that the prevalence of *Mannheimia haemolytica* in Ladang Rakyat Terengganu, Cheneh was higher in local adult goats and can be isolated during monsoon season. The small percentage of the isolated *Mannheimia haemolytica* may be probably due to the quite efficiently vaccination in this farm.

ABSTRAK

Mannheimia haemolytica adalah salah satu daripada patogen yang penting di dalam sistem pernafasan haiwan ruminan dan boleh menyebabkan sindrom akut paru-paru yang serius. Kepentingan kajian ini adalah untuk mengkaji peratusan sebenar kehadiran *Mannheimia haemolytica* dan faktor-faktor yang menyebabkan kewujudan patogen ini di Ladang Rakyat Terengganu, Cheneh. Untuk kajian pemencilan ini, spesimen daripada rembesan hidung 120 ekor kambing tempatan dan import yang sihat secara klinikal diambil dan dibahagikan kepada tiga kumpulan iaitu kumpulan sebelum cerai susu, selepas cerai susu dan dewasa. Kutipan sampel dilakukan sebanyak enam kali, tiga kali sebelum musim monsun dan tiga kali semasa musim monsun. Spesimen itu kemudiannya diinokulasi di atas agar darah yang mengandungi 5% darah kambing dan juga agar Mac Conkey. Pengesahan lanjutan untuk pemencilan bakteria dilakukan menggunakan API 20E. Sebagai keputusannya, tiada *Mannheimia haemolytica* yang dipencarkan sebelum musim monsun dan sebanyak 0.97% organisma ini berjaya dipencarkan semasa musim monsun. Oleh itu, dapat disimpulkan bahawa kehadiran *Mannheimia haemolytica* di Ladang Rakyat Terengganu, Cheneh adalah tinggi di dalam kambing tempatan yang dewasa dan dapat dipencarkan ketika musim monsun berlangsung. Peratusan yang kecil daripada pemencilan *Mannheimia haemolytica* mungkin kerana kesan daripada keberkesanan vaksin yang diaplikasikan di ladang ini.
