ACKNOWLEDGEMENT

I am grateful to Allah s.w.t whose countless blessings enable me to complete my research. Firstly, I would like to extend my sincere thanks to a number of individuals who have helped me in many ways during a year that it has taken to complete this paper. Special thanks go to my supervisors, Mr. Amirrudin Ahmad and Mr. Yusri Yusuf who lead all part of the dissertation writing at different stages and provided helpful criticism, continuous comments, concern and patience. I also owe a debt of knowledge to librarians at Sultanah Nur Zahirah Library of Universiti Malaysia Terengganu for allowing me to collect all the information and references needed for my dissertation. Not to forget Dr. Juanita Joseph who expertly arranged the procedure and format of the research project. Thank you very much for your kind assistance and hardship. A million thanks to INOS, JSB, JSM, FST and FMSM for all kinds of assistance, lab equipment and chemicals that have been provided to conduct my study.

I also want to thank deeply to my patient and understanding family for their support and to my supportive beloved man for putting up with all those hardship during the period of preparing this work. Not to forget, specially thanks to my wonderful and helpful friends, Siti Soleha Harman Shah, Azlyn Nadiah Mohd Tahir, Nurmuna Mohd Noor, Mohd Azri Othman, Abang Jefri Abang Mansor, Adam Iskandar and my dear Zool Nasri Sapie who has helped me a lot during my samplings. Without the help from all of you, I might not be able to complete this research on time. Many other individuals (including several anonymous people) have provided valuable time, energy, opinion and technical help for this works. Heartfelt thanks to all of you!

ABSTRACT

Determination of abundance, composition and diversity of fish inhabits the rocky shore at Kuala Abang and Seberang Pintasan, Terengganu, Peninsular Malaysia were done by both active and passive removal techniques from August to December successfully collected and recorded about 22 families consist of 46 species. From the total amount of individual caught, Blenniidae is the most dominant family in terms of number of species collected (19.6%). Gobiidae is the most abundant family in terms of number of individuals recorded with 44.1%. Habitats in both locations have no significant differences ($p=0.908$) with similar family being captured due to similarity in habitat, water depth and also environmental variables. Ecological indices such as Shannon, Simpson, Margalef, Menhinick, Hill and Evenness were computed to assess and to compare the fish abundance, composition and diversity of Kuala Abang and Seberang Pintasan rocky shores, where both locations give similar results with only slight differences. Sorenson's Index of Similarity indicate a low affinity (44.1%) between both site indicating that there were only a few species that the two sites share in common. However, *t*-test does not show a significant difference between the two locations with ($p = 0.908$). Factors contributing to no significant difference condition were discussed and some recommendations were made.

ABSTRAK

Penentuan kelimpahan, komposisi and taburan ikan yang dijalankan melalui teknik perpindahan secara aktif dan pasif di pantai berbatu Kuala Abang dan Seberang Pintasan, Terengganu, Semenanjung Malaysia dari bulan Ogos hingga Disember telah berjaya merekodkan sebanyak 22 famili yang terdiri daripada 46 spesis. Dari pada jumlah keseluruhan individu yang ditangkap, Blenniidae merupakan famili yang mendominasi berdasarkan bilangan spesis (19.6%). Gobiidae pula merupakan famili yang mempunyai kelimpahan bilangan individu yang tertinggi dengan peratusan 44.1%. Habitat di kedua-dua lokasi kajian menunjukkan tiada perbezaan signifikan ($p=0.908$) di mana famili ikan yang di perolehi adalah seakan-akan sama. Ini adalah disebabkan oleh kesamaan dari segi habitat, kedalaman paras air dan juga persekitaran di antara kedua-dua lokasi. Index-index ekologi seperti Shannon, Simpson, Margalef, Menhinick, Hill dan Evenness yang digunakan telah ditafsirkan untuk menilai dan membandingkan kelimpahan, komposisi dan taburan ikan di kawasan pantai berbatu Kuala Abang dan Seberang Pintasan dimana kedua-dua lokasi tersebut memberikan keputusan yang seakan-akan sama dengan hanya perbezaan kecil. Index Kesamaan Sorenson's menunjukkan persamaan yang rendah (44.1%) di antara kedua-dua dan membuktikan hanya sesetengah spesis sahaja yang sama di antara kedua-dua lokasi kajian. t -test juga menunjukkan keputusan tiadanya perbezaan signifikan di antara kedua-dua lokasi dengan ($p = 0.908$). Faktor-faktor yang mempengaruhi keputusan t -test telah dibincangkan dan beberapa saranan juga telah disertakan.
