PENGAKUAN DAN PENGESAHAN LAPORAN  
PROJEK PENYELIDIKAN I DAN II

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk: **Production of chitosan from marine crab, *Scylla serrata*** oleh **Siti Asmaa' binti Baharudin** No. Matrik **UK 12059** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini telah dikemukakan kepada Jabatan Sains Marin sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah **Sarjana Muda Sains (Biologi Marin)**, Fakulti Pengajian Maritim dan Sains Marin, Universiti Malaysia Terengganu.

Disahkan oleh:

Penyelia Utama **DR. AHMAD SHAMSUDDIN BIN AHMAD**  
Nama: Lecturer  
Cop Rasmi: Department of Marine Science

## **ACKNOWLEDGEMENTS**

With the name of Allah and thanks to Him because of His blessing and mercy, I manage to complete this thesis.

I would like to give my sincere thanks to the people who have given me helps during my final year project research. My thanks go to my supervisor, Dr. Ahmad Shamsuddin bin Ahmad and my co-supervisor, Dr. Zainuddin bin Bachok for their patience, encouragement and support. To BioDiversity Laboratory assistant, a lot of thank for their attention and support. To my fellow lab companions, Kamaliah Kasmaruddin, Kumari Geetha d/o Muniandy, Suraya Gunawan, Shafarini Mokhtar, Chong Huay Meeng and Farhana Nordin thanks a lot for their attention, and support.

I also want to appreciate my roommate, Nur Akmal Suliman, Afifat Ahmad and Nur Aini Mat Budari because of their patience, caring, encouragement and support and always stay beside me.

Special thanks to my beloved parent and family that totally gave their support, encouragements and understand my situation during the completion of this thesis.

## **ABSTRACT**

This study was conducted to determine the production of chitosan from marine crab, *Scylla serrata*. Crab shell need to undergo of dimineralization (DM), deproteinizition (DP), and deacetylation (DA) process in order to produced chitosan. Purpose of this study was to produce chitin and chitosan from the crab shell, with two different method been compared (reversing method and traditional method. Physicochemical and functional properties effect of sample due to the changes in modification or reversing method, where demineralization initiate the method but not in deproteinization process which commonly practiced in traditional method. The chitosan yield from modification method (DMPA) is higher with 53.7% compared with 53.0% from traditional method (DPMA). The result from physicochemical analysis (moisture and ash content) shown that moisture content in traditional method is lower than modification with 1.3 % to 1.7% respectively. The results from both samples are acceptable. For ash content, the percentage of modification method is lower than traditional method with 78.7% and 85.8% respectively. Chromatography paper and HPLC analysis showed glucose and glucosamine present in sample of chitin and chitosan.

## **PENGHASILAN CHITOSAN DARIPADA KETAM LAUT, *Scylla serrata***

### **ABSTRAK**

Kajian ini mengenai penghasilan kitosan daripada sampel kulit ketam, *Scylla serrata*. Kulit ketam ini perlu melalui proses dinyahmineral (DM), dinyahprotein (DP), dan dinyah kumpulan asetil (DA) sebelum menjadi kitosan. Tujuan kajian ini dilakukan untuk menghasilkan kitin dan kitosan dari kulit ketam ini. Kedua, untuk membezakan dan memastikan cara yang terbaik untuk menghasilkan chitosan sama ada teknik tradisional (No dan Meyer, 1995) atau teknik modifikasi “reversing” (Fernandez, 2004). Terdapat kesan kimia fiziko dan bentuk terhadap sampel akibat perubahan proses untuk metodologi tradisional dan proses modifikasi di mana dimulakan dengan proses dinyahmineral bukan dengan proses dinyahprotein seperti metod tradisional. Dalam kajian ini, kitosan yang dihasilkan oleh metod modifikasi (DMPA) lebih banyak dengan 53.7% berbanding 53.0% daripada metod tradisional (DPMA). Keputusan analisis kimia fiziko (kelembapan dan sampel abu) menunjukkan kadar kelembapan metod tradisional lebih rendah berbanding modifikasi 1.3% dan 1.7%. Kadar kelembapan kedua-dua sampel adalah diterima. Bagi sampel abu, juga menunjukkan peratusan yang rendah bagi metod modifikasi berbanding metod modifikasi dengan 78.7% dan 85.8%. Bagi analisis kertas kromatografi dan juga HPLC, menunjukkan sampel kitin dan kitosan mengandungi gula glukosa dan glukosamin.
