## **ACKNOWLEDGEMENT**

In the name of Allah, The Most Gracious and The Most Merciful.

First of all, I am very grateful to Allah S.W.T for His blessing and for being able to complete this thesis. I would like to express my sincere appreciation and deepest gratitude to my supervisor, Prof. Faizah bt. Shaharom who is willing to take me under her supervision and give me a chance to present and show my talent. She also taught and give guidance so that I be able to complete this thesis well.

I also want to thank a lot to all of the staffs and laboratory assistant, En. Mat Zan, En. Jalal and En. Syed and the special thanks to Pn. Kartini for her willingness to guidance in my laboratory work.

Thanks also to all my friends for their kindness and support in helping me to complete my project. Lastly, my greatest appreciation and acknowledge the sacrifices, guidance and encouragement received throughout these years from my beloved family members especially for my parents and my siblings.

I hope this valuable thesis just not for me, but will be for ours to take the advantages of. Thank you very much.

## **ABSTRACT**

Identification, prevalence and mean intensity of ectoparasites on 40 commercial-mariculture fish seabasses (*Lates calcarifer*) kept in floating cages from mariculture farms in Setiu, Terengganu were studied. Parasites were identified from the fin, skin, eye, operculum and gills of the fish. Three species of parasitic protozoa (*Cryptocaryon irritans*, *Henneguya* sp. and *Trichodina* sp.), two species of copepod (*Caligus* sp. and *Lernanthropus latis*) and a monogenean species (*Pseudorhabdosynochus* sp.) were identified from seabasses. Parasites were found from all parts of the body but gills were more heavily infected. Prevalence and mean intensity of *Pseudorhabdosynochus* sp. was the highest compared to others parasites. Prevalence and mean intensity on Sea bass (*Lates calcarifer*) were 100% and 84.95 respectively.

**Pengenalpastian Ektoparasit Ke Atas Ikan Siakap (*Lates calcarifer*)  
Dalam Sangkar Kultur Di Setiu, Terengganu.**

**ABSTRAK**

Pengenalpastian, prevalen dan min keamatan ektoparasit pada 40 ekor ikan marikultur komersil iaitu ikan siakap (*Lates calcarifer*) yang dipelihara dalam sangkar terapung di Setiu, Terengganu telah dikaji. Penentuan parasit ditentukan pada bahagian sirip, kulit, mata, operkulum dan insang. Tiga jenis spesis protozoa iaitu *Cryptocaryon irritans*, *Henneguya* sp. dan *Trichodina* sp., dua kopepod iaitu *Caligus* sp. dan *Lernanthropus latis* serta satu spesis monogenea iaitu *Pseudorhabdosynochus* sp. telah dikenalpasti daripada ikan tersebut. Parasit ditemui pada hampir semua badan ikan yang diperiksa dan bahagian insang paling sering dijangkiti. Prevalen dan min keamatan *Pseudorhabdosynochus* sp. adalah paling tinggi berbanding parasit-parasit lain. Prevalen dan min keamatan parasit dalam ikan siakap (*Lates calcarifer*) adalah 100% dan 84.95 masing-masing.
