Date : 18 Dec 2008

ACKNOWLEDGEMENT

Alhamdulillah, all praises to Almighty Allah S.W.T. for his blessings, this study has been done successfully. Praises to Prophet Muhammad (may peace be upon him), the greatest creation who bought light and peace throughout the universe.

I would like to express my deepest gratitude to En. Fisal B. Haji Ahmad, as Final Year Project coordinator, cum my supervisor of this project for his kindness, support, patience, supervision, and unlimited guidance throughout this study. May Allah bless him always.

I owe a heartfelt thank you to my supervisor's research assistant, En. Ameerdza for his kindness, supervision, advice and dedication in guiding me in order to finish this project. Indeed, his comments, teaching and help have contributed a lot to this project.

Special thanks go to the staffs of Food Science and Food Chemistry Laboratory, Department of Food Science, UMT especially to Pn. Fadlina, Pn. Zarina, Pn. Aniza, and Pn. Nasrenim for the help and willingness to offer a suitable and comfortable laboratory for this project.

Also I will never forget the ones who have help me in completing this study. They are Shaira Shuwari, Norhazwani, and Rafidah.

Last but not least, I am most thankful to my beloved family and friends for their helpfulness and pray which blessed me and gave me the strength and motivation to stay focus and positive in completing this project. May Allah cherish your life.

ABSTRACT

This study was conducted to determine and compare the physicochemical characteristics of anchovy sauce (budu) produced in Kelantan and Terengganu, since there were only a few studies on budu produced in Malaysia. Six samples of budu which is three samples from Kelantan and three samples from Terengganu respectively were collected to be analyzed. The physical properties, chemical compositions, and the amino acids profile of budu were investigated in this study. For physical characteristics, the color and viscosity analyses have been done where as for the chemical compositions analyses, it was included the analyses of pH, salt content, and proximate (moisture, protein, fat, ash, and carbohydrate content). Lastly, the amino acids profile analyses was also conducted to investigate what are the amino acids that available in anchovy sauce. By using HPLC, we have successfully determined seventeen amino acids that available in anchovy sauce. The physicochemical characteristics of budu samples were almost similar to most of the data found in the literature. Budu samples were slightly acidic, with pH between 5.02 and 5.92. The viscosity of the sample showed the significant different among all the samples, between 46.15 mPa-s and 112.52 mPa-s. Results showed that budu contained high amount of salt and protein, average between 38.37% - 51.23%, and 9.69% - 15.02 %, respectively. The data also indicated that budu contained low amount of fat and carbohydrate, where fat content was less than 1%, and carbohydrate was between 0.07% and 6.51%. The data also showed that ash and moisture content in budu were not significantly different. It contained about 15.75% - 18.81% of ash, and 64.27% - 69.46% of moisture. For the amino acids profile, glutamic acid showed the highest concentration in all the samples in both states. The content of essential amino acids (lysine, leucine, isoleucine, threonine, and valine) were found to be dominant in budu.

ABSTRAK

Kajian ini telah dijalankan untuk menentukan dan membandingkan perbezaan ciri-ciri fizikal dan kimia bagi budu yang dihasilkan di Kelantan dan Terengganu memandangkan hanya terdapat sedikit sahaja kajian yang telah dijalankan terhadap budu yang dihasilkan di Malaysia. Enam sampel budu dari tiga buah kilang dari Kelantan dan tiga buah kilang lagi dari negeri Terengganu telah diambil untuk dijalankan kajian. Kajian yang telah dijalankan terhadap sampel budu ialah kajian mengenai ciri-ciri fizikal, kandungan kimia, dan asid amino profil. Bagi ciri fizikal, hanya warna dan kelikatan bagi sampel sahaja yang dikaji. Manakala bagi kajian tentang kandungan kimia pula ialah pH, kandungan garam dan proksimat (kandungan air, protin, lemak, abu, dan karbohidrat). Analisis terakhir ialah untuk mengetahui kandungan asid amino dalam budu. Sebanyak tujuh belas asid amino telah dikira dengan menggunakan HPLC dalam kajian ini. Hasil kajian ini mendapati bahawa ciri fizikal dan kimia bagi sampel budu tidak jauh berbeza daripada data hasil kajian-kajian lepas. Sampel budu dalam kajian ini adalah bersifat sedikit berasid dengan pH antara 5.02 dan 5.92. Kelikatan budu pula menunjukkan tidak terdapat banyak perbezaan bererti antara semua sampel, iaitu antara 46.15 mPa-s dan 112.52 mPa-s. Keputusan kajian juga menunjukkan bahawa budu mengandungi kandungan garam dan protin yang tinggi iaitu masing-masing antara 38.37% - 51.23%, dan 9.69% - 15.02 %. Namun begitu, kandungan lemak dan karbohidrat adalah rendah dalam budu iaitu kurang daripada 1% lemak, dan 0.07% hingga 6.51% bagi karbohidrat. Kandungan debu dan air bagi sampel budu menunjukkan perbezaan yang tidak bererti. Sampel budu mengandungi antara 15.75% - 18.81% debu, dan 64.27% - 69.46% kandungan air. Bagi ujian kandungan asid amino profil, kandungan asid glutamik adalah paling banyak dalam semua sampel budu bagi kedua-dua negeri. Budu juga mengandungi asid amino perlu, seperti lysine, leucine, isoleucine, threonine, dan valine yang tinggi bagi semua sampel.
