DECLARATION AND VERIFICATION REPORT  
FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled:

**A study of ghost nets in coral reef area at Bidong Island, Terengganu by Nurul Akma Binti Mohd Yusof Matric No. UK18073** have been examined and all errors identified have been corrected. This report submitted to the Department of Marine Science and as a partial fulfillment toward obtaining the Degree of Marine Biology, Faculty of Maritime Study and Marine Science, University Malaysia Terengganu, Terengganu, Malaysia.

## **ACKNOWLEDGEMENTS**

Bismillahirrahmanirrahim,

All praises to Allah whose countless blessings enable me to finish the project report. I am fortunate in having the invaluable advise, comments and guidance from Miss Zahaitun Mahani binti Zakariah as my project's supervisor and Dr Razak Zakariya as my second project's supervisor. I am indebted to their kind assistance and supervision. Without them, this project would not have been carrying out and the big thank to Petronas Carigali Sdn. Bhd (PCSB) for supporting this project in Bidong Island.

No undertaking of this magnitude can be accomplished alone; it is grateful appreciation that I acknowledge the assistance of scuba diving team, Mr Sainol Aimi bin Saidin, Mr Syed Afzan b Syed Bidin, Mr Mohd Naim, Mr Effie Helmi Ariffin and also Mr Yuzwan B. Mohamad for their generosity in helped to conduct the scuba diving observation. I would like to express my deepest appreciation to my diving buddy Ahmad Shariy Fizzree for all his help during sampling and my marine debris buddy, Razlan bin Nuzol Azam and Mohd Hafiz Purhanudin for their accompany.

My deepest gratitude also goes to my beloved parent, Mohd Yusof bin Mareiyon and Siti Jaharah binti Jaafar, sisters, and brother in law and also my dearest for their endless love and moral support during my day in university.

Finally, I would like to thank to my colleagues for all their cooperation and loyalty made me stronger in the challenge. Thank you.

**A STUDY OF GHOST NETS IN CORAL REEF AREA AT BIDONG ISLAND,  
TERENGGANU**

**ABSTRACT**

A study of ghost net in the coral reef area was conducted by using scuba diving method in three stations at Bidong Island. Fishing related debris was the highest benthic marine debris found with 49.4% from the total of 77 samples benthic marine debris removed. Fishing gear related debris was comprised of trawl nets, gill nets, purse seine nets and fishing lines. Fishing lines was recorded as the highest number of marine debris found with of total 20 items. 10 items of trawl net was found in ghost nets category followed by with 5 items of gill net and 3 items of purse seine nets. Rope category was the second abundance of benthic marine debris found with 35% (25 items) and followed by others category with 18% (14 items). For ghost nets view of degree of epibiont encrustation, 4 classes of degree of epibiont encrustation was determine comprised of none degree of epibiont encrustation found, lightly, moderate and heavy degree of epibiont attach with nets. Category from lightly encrustation of epibiont obtained the highest data with 28 items. 20 items from the total was recorded by fishing lines. With existence of epibiont encrustation, it was possible to state that ghost nets collected were remains submerged in the water for an extent of period. More study in benthic marine debris should conduct in Malaysia and in a same time more education programs and awareness among Malaysian people are suggested.

**KAJIAN MENGENAI ‘GHOST NETS’ YANG TERDAPAT KAWASAN  
TERUMBU KARANG DI PULAU BIDONG TERENGGANU.**

**ABSTRAK**

Satu kajian ‘ghost nets’ dalam kawasan terumbu karang dijalankan dengan menggunakan kaedah selam skuba dalam tiga stesen di Pulau Bidong. Sampah bentik dari jenis peralatan penangkapan ikan mencatatkan jumlah data yang paling tinggi dijumpai dengan 49.4% dari jumlah 77 sampah marin bentik dikeluarkan semasa kajian ini dijalankan. Peralatan menangkap ikan yang dijumpai termasuklah daripada jenis pukat tunda pukat insang, pukat kaya dan tali joran. Tali joran telah mencatatkan jumlah sampel tertinggi yang dijumpai dengan 20. 10 sampel dari pukat tunda ditemui diikuti oleh pukat insang dengan 5 sampel dan pukat kaya. Samaph marine bentik dari jenis tali pula mencatatkan jumlah kedua tertinggi dengan 35% (25 sampel) dan diikuti oleh kategori jenis lain-lain dengan 18% (14 sampel). Peratus keseluruhan ‘ghost nets’ diliputi oleh organism laut yang melekat dikategorikan kepada 4 kelas iaitu tiada peratus organism melekat dengan ‘ghost nets’, hanya sedikit organisma melekat pada ‘ghost nets’, separuh daripada ‘ghost nets’ diliputi oleh organisma marin dan kebanyakan permukaan ‘ghost nets’ diliputi oleh organisma marin. ‘Ghost nets’ yang dijumpai dengan hanya sedikit organisma melekat padanya mencatatkan jumlah yang paling tinggi dengan 28 sampel. 20 daripada 28 sampel tersebut adalah dari jenis tali joran. Kemudian diikuti oleh ‘ghost nets’ yang dijumpai dengan separuh permukaannya diliputi oleh organisma iaitu dengan jumlah 9 sampel. Kehadiran organisma yang melekat padasampah marin bentik, ianya boleh disimpulkan bahawa sampah tersebut telah berada di dalam air dalam satu jangka waktu tertentu

bergantung dengan jumlah kepadatan epibiont organisma itu terhadap sampah. Kajian mengenai sampah marin bentik ini masih baru di Malaysia, oleh itu lebih banyak kajian seumpama ini harus dilakukan bagi menangani isu sampah marin bentik yang memberi kesan buruk kepada hidupan laut. Lebih kerap program berunsurkan kesedaran dan akademik terhadap kajian marin perlu dijalankan supaya masalah ini dapat dibendung.
