PENGAKUAN DAN PENGESAHAN LAPORAN MAT 4499 B

Adalah ini diakui dan disahkan bahawa laporan penyelidikan bertajuk **A Combination Of Fuzzy Autogressive Integrated Moving Average Model For Forecast Malaysia's Currency Exchange Rates** oleh **Ho Chui Yee**, No matrik: **UK 14033** telah diperiksa dan semua pembetulan yang disarankan telah dilakukan. Laporan ini dikemukakan kepada Jabatan Matematik sebagai memenuhi sebahagian daripada keperluan memperolehi Ijazah Sarjana Muda Sains Matematik Kewangan, Fakulti Sains dan Teknologi, UMT.

ACKNOWLEDGEMENTS

It is a pleasure to thank all those people who help me made this thesis possible and an enjoyable experience for me.

It is difficult to overstate my gratitude to my supervisor, Dr. Mohd Lazim bin Abdullah. With his enthusiasm, his inspiration, and his great efforts to explain things clearly and simply, Dr. Mohd Lazim helped me a lots while finishing my thesis. His patience and kindness, as well as his academic experience, have been invaluable to me.

I wish to thank everybody with whom I have shared experiences in life. From the people who first persuaded and got me interested into the study of mathematics, especially those who also played a significant role in my life, to those which with the gift of their company made my days more enjoyable and worth living.

I am grateful to all my friends for their encouragement and help especially for the friends from University Malaysia Terengganu, for being the surrogate family during the many years I stayed there and for their continued moral support thereafter.

I cannot end without saying how grateful I am with my family for providing a loving environment for me. They have always supported and encouraged me to do my best in all matters of life.

A COMBINATION OF FUZZY AUTOREGRESSIVE INTEGRATED MOVING AVERAGE MODEL FOR FORECAST MALAYSIA'S CURRENCY EXCHANGE RATES

ABSTRACT

Time series models such as Auto-Regressive Integrated Moving Average (ARIMA) models are the most important forecasting models used in financial market forecasting over the past three decades. However, the recent studies show that the combination ARIMA models with different kind of models can be an effective method of improving upon their predictive performance. Due to factors of uncertainty from the integral environment and rapid development of new technology, little data in a short time period to forecast future situations is encourage. This study is mainly concerned on the effectiveness of ARIMA and combination fuzzy ARIMA (FARIMA) forecasting model, which combines the time series ARIMA model and the fuzzy regression model. Both of these models are applied in forecast the foreign exchange rates of Malaysian Ringgit to US dollars. FARIMA model includes both interval models with interval parameters and the possible distribution of future value. Based on the results, it can be shown that the combination FARIMA can makes a good forecast by using fewer observations than the ARIMA model.

SATU KOMBINASI MODEL KABUR PURATA BERGERAK TERKAMIR AUTOREGRESIF UNTUK RAMALAN KADAR PERTUKARAN WANG DI MALAYSIA

ABSTRAK

Analisis siri masa model seperti model Purata Bergerak Terkamir Autoregresif (ARIMA) merupakan model-model peramalan yang penting dalam peramalan pasaran kewangan sejak tiga dekad yang lalu. Walaubagaimanapun, kajian baru-baru ini menunjukkan gabungan model ARIMA dengan jenis model lain yang berbeza boleh menjadi satu kaedah yang berkesan dalam peningkatan prestasi satu peramalan. Akibat daripada faktor-faktor ketakpastian daripada persekitaran dan pembangunan teknologi baru yang pesat, data yang sedikit dalam satu jangka masa pendek adalah digalakkan dalam peramalan. Kajian ini terutamanya tertumpu kepada keberkesanan bagi peramalan model ARIMA dan gabungan model ARIMA kabur (FARIMA) iaitu kombinasi siri masa model ARIMA dan model regresi kabur. Kedua-dua model ini digunakan untuk peramalan kadar pertukaran asing Ringgit Malaysia dengan dolar Amerika. Model FARIMA termasuk model selang dengan parameter selang dan taburan berpotensi bagi nilai masa depan. Berdasarkan keputusan, model FARIMA memberikan satu ramalan yang baik dengan penggunaan data ramalan yang kurang daripada model ARIMA.
