SEDIMENT DISTRIBUTION AROUND CORAL AREA AT BIDONG ISLAND

By

MOHD SYAIBUL HAMDI B MAT

**Research Report submitted in partial fulfillment of
the requirements for the degree of
Bachelor of Science (Marine Science)**

**Department of Marine Science
Faculty of Maritime Studies and Marine Science
UNIVERSITI MALAYSIA TERENGGANU
2011**

This project report should be cited as:

Hamdi, M. S. 2011. Sediment Distribution around Coral Area at Bidong Island.
Undergraduate thesis, Bachelor of Science (Marine Science), Faculty of
Maritime Studies and Marine Science, University Malaysia Terengganu,
Terengganu.

DECLARATION AND VERIFICATION REPORT

FINAL YEAR RESEARCH PROJECT

It is hereby declared and verified that this research report entitled:

SEDIMENT DISTRIBUTION AROUND CORAL AREA AT BIDONG ISLAND
by **MOHD SYAIBUL HAMDI B MAT**, Matric No. **UK 18050** has been examined and all errors identified have been corrected. This report is submitted to the Department of Marine Science as partial fulfillment towards obtaining the **Degree of Science (Marine Science)**, Faculty of Maritime Studies and Marine Science, University Malaysia Terengganu.

ACKNOWLEDGEMENTS

Alhamdulillah, with His permission which give me the strength and blessing for complete this final year project thesis until end. The path which paved the way for me to wade through all the intricacies to arrive at the finish line.

First of all, i am extremely like to express my gratitude to my supervisor, Associate Professor Dr. Rosnan B Yaacob and my second supervisor, Dr Nor Antonina bt Abdullah for their invaluable academic experience and knowledge and for their continued support, patience, helpfulness and encouragement towards the exertion to accomplish this final year thesis.

I also would like to acknowledge my special thanks to master students under Associate Professor Dr. Rosnan b Yaacob, Mr Effi Helmi, Mr Zaini and Mrs Aishah who also worked with me on my draft and helpfulness to giving their advice and support to accomplish this final draft. Besides that, my gratitude goes to my coordinator, Dr Antonina Abdullah, MOSEA Lab staff especially En Mohd Naim, En Kamarun and my colleagues which involved in this project directly or indirectly.

My gratitude also goes to the PETRONAS CARI GALI SDN.BHD for giving me the external support during the sampling operated. Eventually, I'm very grateful to my entire family for their support, encouragement, patience and love that always been there for me.

ABSTRACT

A study was carried out around the Bidong Island in order to determine the general characteristic, grain size distribution of the sediments and comparison was made between these different areas of coral reef and non-reef areas. Samplings were conducted two times at each station. The first and second sampling was done on 25th – 27th March 2010 and 8th – 10th July 2010 that caring out along the Bidong Island area. Sediment samples were collected from 35 stations and three stations from them is from the coral area. Then, they are analyzed for their sedimentological characteristic i.e. means size, sorting, skewness and kurtosis by using dry sieving method and particle size analysis. The sediment mean size value ranged between -0.1Ø – 2.0Ø for the first sampling and -0.31Ø – 1.771Ø for the second sampling. In this study, grain size distribution for all station of study area indicates that some differentiation between station at coral reef area and non-coral reef area. Generally, the sediments in the study area consist mostly of coarse to fine particles. The major portions of the sediment are negatively skewed. This indicates that the study area is under the influence of the rather strong wave and current action.

ABSTRAK

Satu kajian telah dilakukan di perairan Pulau Bidong bagi pengukuran ciri-ciri sedimen, bentuk taburan serta melakukan perbandingan di antara dua kawasan yang berbeza iaitu sampel sedimen dari kawasan terumbu karang dan sampel sedimen dari bukan kawasan terumbu karang. Penyempelan telah dijalankan sebanyak dua kali iaitu pada 25-27 Mac 2010 untuk penyempalan kali pertama dan 8-10 Julai 2010 untuk penyampelan kali kedua. Sampel sedimen telah diambil dari 35 stesen di sekitar perairan Pulau Bidong dengan 3 stesen daripadanya adalah dari kawasan terumbu karang. Kemudian, sampel sedimen tadi di analisis untuk mendapatkan nilai mean, sorting, skewness dan kurtosis dengan menggunakan kaedah analisa ayak kering dan analisa saiz partikel (Malvern Mastersize). Di dalam kajian ini, purata nilai mean bagi penyampelan pertama ialah $-0.1\varnothing - 2.0\varnothing$ dan untuk penyampelan kedua ialah $-0.31\varnothing - 1.771\varnothing$. Dalam kajian ini, taburan untuk saiz partikel bagi semua stesen di kawasan kajian menunjukkan terdapat perbezaan di antara kawasan terumbu karang dan kawasan bukan terumbu karang. Umumnya, sedimen di kawasan kajian terdiri daripada sebahagian besar adalah ‘moderate coarse grain’. Bahagian utama dari sedimen adalah ‘negative skewed’. Hal ini menunjukkan bahawa ada kawasan kajian yang menerima gelombang dan ombak yang agak kuat ketika kajian di jalankan.
