## ACKNOWLEDGEMENTS

Bismillahirrahmanirrahim...

Alhamdulillah, in the name of Allah and bless of Him, thanks for give me healthy and strength to finished my final year project without any obstacle.

In this opportunity, I would like to dedicate my appreciation to my supervisor, Dr Razak Bin Zakariya for his guidance and advice along supervising me. Thank you for all the knowledge and information in guiding me through all the process from starting writing proposal until I finish this thesis, thank you once again.

My dedicate also direct to my friend, Muhammad Taufiq Bin Abu Bakar and master student Nor Fadzleen Binti Jibril for advice, advice and graciously shared their opinion and knowledge for me in the way to complete the study about this project. Their helping I will remember until the end of my life. Not forget to all staff in GIS lab and staff who help me in sampling at Kerteh, thanks a lot.

Thanks also to Department of Meteorology and Department of Irrigation and Drainage for giving me the data that I need in completing my research and study. Without their cooperation, I will not run my project successfully.

Last but not least, my special thanks goes to my lovely parent (abah and ibu) for giving me mental strength and always support my study without any complain and their love is the key for my success.

## ABSTRACT

The area for this study is Kerteh River catchment area that located at Kemaman, Terengganu which have the total area of the watershed is approximately 27 500 hectares. The catchment area consists of rural area, urban area, agriculture area and industry area. The industry activities and the behavior of urbanization bring much strain on utilization of land and river system in Kerteh River catchment. Oil and gas industries area that nearby the catchment area give a significant impact on the generation of runoff and other water fluxes, pollutant transport to water courses and rates of erosion. The main aim of this study was to determine the river flow rate of Kerteh River catchment area and to create a new model of river flow simulation of Kerteh River. The study was done by using in-situ sampling where a current meter was deploy in two sampling station to get the data of flow in Kerteh River. This study also needs the Soil and Water Assessment Tool (SWAT) to predict the impact of land use on water flow. The SWAT model were simulated the watershed process for 10 years (2000-2009). The correlation analysis is being analyzed from the In-situ data and data from AVSWAT. The analysis show that the good relationship which is 0.91. This model is very important for study and predicts the river flow in the future.

# **KAJIAN ALIRAN SUNGAI DI SUNGAI KERTEH, TERENGGANU MENGUNAKAN KAEDAH PENILAIAN AIR DAN TANAH (AVSWAT)**

## **ABSTRAK**

Kawasan kajian dalam penyelidikan ini ialah kawasan tadahan Sungai Kereteh, Terengganu yang mempunyai jumlah luas kawasan aliran sungai kira-kira 27 500 hektar. Kawasan tadahan dilitupi oleh kawasan penempatan, bandar, kawasan pertanian dan kawasan industri. Aktiviti industri dan aktiviti urbanisasi mendatangkan kesan terhadap penggunaan air di kawasan tadahan. Kawasan industri gas dan petroleum juga memberikan kesan kepada penggunaan air, hakisan dan pencemaran. Matlamat kajian ini adalah untuk menentukan kadar aliran air sungai di Sungai Kereteh dan mencipta simulasi aliran air Sungai Kereteh. Kajian dijalankan dengan melakukan kaedah in-situ dimana dua Current Meter telah diletakkan di dua stesyen iaitu Station 1 dan Station 2 untuk mengambil bacaan data bagi arus Sungai Kereteh. Kajian ini juga memerlukan model SWAT (Soil and Water Assessment Tool) untuk meramalkan kesan penggunaan tanah terhadap aliran air sungai. Model SWAT ini mensimulasi proses aliran air sungai menggunakan data dari tahun 2000 hingga 2009. Analisis menunjukkan keputusan daripada kajian in-situ dan data dari AVSWAT menunjukkan hubungan yang baik iaitu dengan korelasi sebanyak 0.91. Model ini sangat berguna dalam kajian mengenai aliran air sungai pada masa akan datang.
