**DECLARATION AND VERIFICATION REPORT
FINAL YEAR RESEARCH PROJECT**

It is hereby declared and verified that this research report entitled:

Finite Element Analysis Of Amidships Compartment Of Monohull Research Vessel by Lee Xiang Ming, Matric No. UK 16480 have been examined and all errors identified have been corrected. This report is submitted to the Department of Marine Science as partial fulfillment towards obtaining the Degree of Bachelor of Applied Science (Maritime Technology), Faculty of Maritime Studies and Marine Science, Universiti Malaysia Terengganu.

ACKNOWLEDGEMENTS

First and foremost, I would like to acknowledge to my supervisors, Mr Che Wan Mohd Noor and Ir. Ferry Manuhutu for guidance, and supervision throughout the research.

Next, I would like to express my gratitude to Mr. Anuar Abu Bakar, who has shared the knowledge of using ABAQUS and also suggested the very useful proposition toward my research.

Besides that, I am appreciated to Kay Marine Shipyard Sdn. Bhd. for providing the required documents for my research and Mr. Steven Lee for the important technical assistance, the study would not be completed without his hand.

Furthermore, I would to thank all the peers from the Program of Maritime Technology for lending their precious hands to complete my final year project.

Last but not least, I would like to express my deepest gratitude to my family. My mum has supported me throughout my lengthy student career and has always been there when I need them. I never forget the ginseng powder form my mum had helped me to sustain countless night for this thesis.

FINITE ELEMENT ANALYSIS OF AMIDSHIPS COMPARTMENT OF MONOHULL RESEARCH VESSEL

Abstract

The finite element simulation results of the monohull amidships subjected to vertical bending moment are presented. The simulated structures are made of aluminum alloy 5083 H116, 6061 T6, 6082 T5, mild steel S235, high tensile steel S355 of nominal ultimate stress reinforced with extruded part of the same material. Besides that, two cases with hull using aluminum alloy 5083 H116 combine with extruded part using aluminum alloy 6061 T6 and 6082 T5 respectively were also generated. The bending moment curvature curves are presented covering the ultimate bending moment of sagging and hogging analysis of each case with the deflection of each model at the ultimate bending moment has been predicted. The study was also including the comparisons of all cases regarding to the ultimate bending moment, maximum stress distribution at the model local penal and the model global ultimate strength. In the final part of the study, the modes of collapse for each model's keels and center girder are discussed. The concept is very useful to identify the governing parameters affecting the ultimate strength of 3D structures under predominant bending moment.

ANALISIS ELEMEN TERHINGGA BAGI BAHAGIAN PEMINGGANG KAPAL PENYELIDIKAN BERBADAN TUNGGAL

ABSTRAK

Keputusan simulasi elemen terhingga bagi peminggang badan kapal tunggal yang tertakluk kepada momen lentur menegak telah dibentangkan. Lima kes simulasi dengan struktur model kapal yang dihasilkan daripada aloy aluminium 5083 H116, 6061 T6, 6082 T5, keluli lembut S235, serta keluli tegangan tinggi S355 dan diperkuuh dengan bahagian diekstrusi daripada bahan yang sama. Selain itu, dua kes dengan plat badan kapal menggunakan aloy aluminium 5083 H116 bergabung dengan bahagian diekstrusi bagi kes masing-masing menggunakan aloy aluminium 6061 T6 dan 6082 T5 juga dihasilkan. Graf momen lentur yang dibentangkan telah meliputi momen lentur mutlak semasa fenomena kapal mengendur dan fenomena kapal meleding bagi setiap kes kajian dengan pesongan model pada momen lentur mutlak diramalkan. Kajian ini juga merangkumi perbandingan antara semua kes kepada momen lentur mutlak, taburan tekanan maksimum terhadap bahagian lokal dan kekuatan mutlak global model. Di bahagian akhir kajian ini, mod runtuh untuk bahagian lunas dan galang tengah setiap model juga diperbincangkan. Konsep ini adalah sangat berguna untuk mengenalpasti parameter yang mempengaruhi kekuatan muktamad struktur 3D di bawah momen lentur dominan.
